Maximum Permissible Exposure Calculations

Date of Report: Jan 31, 2003

Calculations prepared for:

IP Mobile Net

11909 East Telegraph Road
Santa Fe Springs, CA 90670

Calculations prepared by:

Eddie Wong

110 N. Olinda Place
Brea, CA 9283

Model Number: IP4HPV-GPS

FCC Identification: MI7-IPMNIP4H

Fundamental Operating Frequency: 509-512MHz

Maximum Rated Output Power: 40.00 Watts

Measured Output Power: 34.00 Watts

In accordance with 47CFR2.1093(d)(2), source based time averaging is allowed for this type of device:

$$\begin{aligned}\text{Source Based Time Averaging} &= 10\text{LOG}(\text{ON time}/\text{TOTAL time}) \\ &= 10\text{LOG}(389\text{ms}/(389+310) = 699\text{ms}) \\ &= -2.54\text{dB}\end{aligned}$$

$$\text{Therefore the Power Output} = 46.02\text{dBm (40.00W)} - 2.54\text{dB} = \mathbf{43.48\text{dBm (22.284W)}}$$

$$\text{At measured Power Output} = 45.31(34.00\text{W}) - 2.54\text{dB} = 42.77\text{dBm (18.92W)}$$

MPE Limit in accordance with 1.1310(b): Limits for general population/uncontrolled exposure

$$\text{MPE Limit for 509 MHz} = 509/1500 = \mathbf{0.3393 \text{ mW/cm}^2} \text{ (3.339W/M}^2\text{)}$$

$$\text{MPE Limit for 512 MHz} = 512/1500 = 0.3413 \text{ mW/ cm}^2$$

	Power Output (Watts)	Power Density Limit (mW/cm ²)	Minimum Distance (Meters)
Rated power of 40W	22.28	0.3393	1.0
Measured power of 34W (Also this power listed on Grant)	18.92	0.3393	0.6663

Antenna gain = 3 dBi = linear gain of 2 with reference to an isotropic antenna.

$$\text{Power Density (W/M}^2\text{)} = (30 * P_t * G) / (d^2 * Z_o)$$

P_t = Power Delivered to the Antenna

d = Distance in meters

G = Antenna Gain

Z_o = Impedance of Free Space

The typical vehicle used by police was measured, and a separation distance of 1 meter was found to be an appropriate distance. Under normal operating conditions, the antenna will maintain a separation of

1 meter from all persons. As can be seen from the MPE results, at rated power, this device passes the limits specified in 1.1310 at a distance of 1.0 Meter.

$$3 \text{ dBi gain} = 10 \text{ Log } G$$

$$G = \text{antilog}(3/10) = \text{ratio of 2 over Isotropic.}$$

$$d = \sqrt{\frac{30 \times 22.28 \times 2}{3.339 \times 377}}$$

$$D = 1.0 \text{ meter.}$$
