(1) Power transfer frequency is less than 1 MHz.

--Yes, the device operated in the frequency range from 115 KHz to 205KHz

(2) Output power from each primary coil is less than or equal to 15 watts. --Yes, the maximum output power of the primary coil is 15 W

(3) The system may consist of more than one source primary coils, charging one or more clients. If more than one primary coli is present, the coil pairy may be powered on at the same time. --Yes, the product has a plurality of coil, and support the same coil hair.

RF exposure compliance will need to be determined with respect to 1.1307(c) and (d) of the FCC rules. The emissions should be within the limits at 300kHz in Table 1 of 1.1310(use the 300kHz limits for 150kHz:614V/m,1.63A/m).

4 Test Setup

5 Test Procedure

1) The RF exposure test was performed in anechoic chamber.

2) The measurement probe was placed at test distance (15 cm from all sides and 20 cm from the top) which is between the edge of the charger and the geometric center of probe.

3) The highest emission level was recorded and compared with limit as soon as measurement of each points (A, B, C, D, E) were completed

4) The EUT was measured according to the dictates of KDB 680106 D01v03r01 Remark: The EUT's test position A, B, C, D and E is valid for the E and H field measurements

When the Sum of the MPE Ratio + Sum of the SAR Ratio for All Antennas \leq 1.0

MPE Ratios are Calculated as [(MPE1/Limit)+(MPE2/Limit)]=0.73/1.63+0.00218/1=0.45≤1.0
