

## RF Exposure Calculation

Applicant: FALCOM GmbH

FCC ID: QIXMAMBO56

The internal antenna used for this mobile transmitter must provide a separation distance of at least 20 cm from all persons and must not be co-located or operated in conjunction with any other antenna or transmitter.

A safety statement concerning minimum separation distances from enclosure of the MAMBO56 will be integrated in the user's manual to provide end-users with transmitter operating conditions for satisfying RF exposure compliance.

The appropriate Max conducted power can be drawn from the test report no. G0M20603-0284-P-2224.

For transmitter operating in the 824-849 MHz range, paragraph 1.1310 Table 1 limits maximum permissible exposure (MPE) to 0.549 mW/cm<sup>2</sup> for uncontrolled environments and 2.75 mW/cm<sup>2</sup> for controlled environments.

For transmitter operating in the 1850-1910 MHz range, paragraph 1.1310 Table 1 limits maximum permissible exposure (MPE) to 1 mW/cm<sup>2</sup> for uncontrolled environments and 5 mW/cm<sup>2</sup> for controlled environments.

The far field on-axis power flux density (W/m<sup>2</sup>) is calculated using the following formula:

S = Power density (mW/cm<sup>2</sup>)

ERP = effective radiated power (mW)

EIRP = isotropically radiated power (mW)

r = Distance in cm
