About This Guide

This guide is a complement to Quick Installation Guide. The Quick Installation Guide provides instructions for quick internet setup, while this guide contains details of each function and demonstrates how to configure them.

When using this guide, please notice that features of the router may vary slightly depending on the model and software version you have, and on your location, language, and internet service provider. All screenshots, images, parameters and descriptions documented in this guide are used for demonstration only.

Conventions

In this guide the following conventions are used:

| Convention | Description |
|------------|---|
| Underlined | Underlined words or phrases are hyperlinks. You can click to redirect to a website or a specific section. |
| Teal | Contents to be emphasized and texts on the web page are in teal, including the menus, items, buttons and so on. |
| > | The menu structures to show the path to load the corresponding page. For example, Advanced > Wireless > MAC Filtering means the MAC Filtering function page is under the Wireless menu that is located in the Advanced tab. |
| Note: | Ignoring this type of note might result in a malfunction or damage to the device. |
| Ø Tips: | Indicates important information that helps you make better use of your device. |

Speed/Coverage Disclaimer

*Maximum wireless signal rates are the physical rates derived from IEEE Standard 802.11 specifications. Actual wireless data throughput and wireless coverage are not guaranteed and will vary as a result of 1) environmental factors, including building materials, physical objects, and obstacles, 2) network conditions, including local interference, volume and density of traffic, product location, network complexity, and network overhead, and 3) client limitations, including rated performance, location, connection, quality, and client condition.

More Info

The latest software, management app and utility are available from the Download Center at https://www.tp-link.com/support.

The Quick Installation Guide can be found where you find this guide or inside the package of the router.

Specifications can be found on the product page at https://www.tp-link.com.

A TP-Link Community is provided for you to discuss our products at https://community.tp-link.com.

Our Technical Support contact information can be found at the Contact Technical Support page at https://www.tp-link.com/support.

Chapter 1

Get to Know About Your Router

This chapter introduces what the router can do and shows its appearance. It contains the following sections:

- Product Overview
- Appearance

1. 1. Product Overview

To meet the wireless needs of almost any situation you might encounter, the TP-Link portable router, with multiple operating modes, is designed for home and travel use. The portable size of the router means that you can put it in your pocket and take it with you wherever you go. The built-in adapter makes it perfect for travelers, students, and anyone else living life on the go.

1.2. Appearance

LED Explanation

| LED | Status | Indication |
|-----------------|----------|---|
| dy (Daniela) | On | The router is on. |
| <u></u> (Power) | Blinking | The router is initializing or being upgraded. |
| | On | The internet is available. |
| | Off | The internet is unavailable. |
| | On | The wireless network is enabled. |
| | Blinking | The router is connecting to the host network when in Range Extender or Client Mode. |
| | Off | The wireless network is disabled. |
| 4.4.100 | On | A USB device is connected. |
| ∜ (USB) | Off | No USB device is connected |

| LED | Status | Indication |
|---------|----------|---|
| | On | The light stays on for 5 minutes when a WPS connection is established, then goes off. |
| △ (WPS) | Blinking | WPS connection is in progress. |
| | Off | No WPS connection is established. |

Port and Button Description

| Item | Description |
|----------------|--|
| Mode Switch | This button is used to switch the operating mode of the router. |
| WAN/LAN | This port functions as the WAN port in Router mode and as the LAN port in Hotspot, Access Point, Range Extender and Client mode. |
| Power | The port is used to connect the power adapter. |
| 3G/4G USB | This port is used to plug a 3G/4G modem or a USB disk into. * 3G/4G modem is only supported in some regions. |
| △ (WPS) | To establish WPS connection, press this button. |

Chapter 2

Connect the Hardware

This chapter contains the following sections:

- Position Your Router
- Connect Your Router

2. 1. Position Your Router

 The router should not be located where it will be exposed to moisture or excessive heat.

- Place the router in a location where it can be connected to the various devices as well as to a power source.
- Make sure the cables and power cord are safely placed out of the way so they do not create a tripping hazard.
- The router can be placed on a shelf or desktop.
- Keep the router away from devices with strong electromagnetic interference, such as Bluetooth devices, cordless phones and microwaves.

2. 2. Connect Your Router

There are five operating modes supported by this router: Standard Wireless Router, Access Point, Range Extender, Client and Hotspot Router. Please choose an operating mode you need and carry out the corresponding steps.

2. 2. 1. Standard Wireless Router Mode

Create an instant private wireless network and share internet to multiple Wi-Fi devices. This mode is suitable for hotel rooms and home networks.

- 1. Switch the operating mode to Share ETH and connect the hardware according to Step A to D.
- 2. Connect your device to the router wirelessly. The Wi-Fi network name and password are on the router's label.
- Note: If the hotel's internet has an authentication process, you will need to authenticate only once and only on one device.

Chapter 2 Connect the Hardware

2. 2. 2. Access Point Mode

Create a wireless network from an Ethernet connection. This mode is suitable for dorm rooms or homes where there's already a wired router but you need a wireless network.

- Switch the operating mode to AP/Rng Ext/Client and connect the hardware according to Step A to D.
- 2. Connect your device to the router wirelessly. The Wi-Fi network name and password are on the router's label.

Note: If the hotel's internet has an authentication process, you will need to authenticate it on EACH device.

2. 2. 3. Range Extender Mode

Repeat signal from an existing wireless network. This mode is suitable to extend wireless coverage, reaching devices that were previously too far from your primary router to maintain a stable wireless connection.

- 1. Switch the operating mode to AP/Rng Ext/Client and plug the router into an electrical outlet near your host AP.
- 2. Connect your device to the router wirelessly or via an Ethernet cable. The Wi-Fi network name and password are on the router's label.

2. 2. 4. Client Mode

In this mode, this device can be connected to another device via an Ethernet cable and act as an adapter to grant your wired devices access to a wireless network, especially for a smart TV, media player, or game console.

Chapter 2 Connect the Hardware

1. Switch the operating mode to AP/Rng Ext/Client and plug the router into an electrical outlet within the signal range of your host AP.

2. Connect your device to the router wirelessly or via an Ethernet cable. The Wi-Fi network name and password are on the router's label.

2. 2. 5. Hotspot Router Mode

In Hotspot Router mode, the router enables multiple users to share internet connection from WISP.

- 1. Switch the operating mode to Share Hotspot and plug the router into an electrical outlet within the range of the public hotspot.
- 2. Connect your device to the router wirelessly or via an Ethernet cable. The Wi-Fi network name and password are on the router's label.

Chapter 3

Set Up Internet Connection Via Quick Setup Wizard

This chapter introduces how to connect your router to the internet via the web-based Quick Setup Wizard.

It contains the following sections:

- Log In to the Router
- Configure the Router

3. 1. Log In to the Router

With a web-based utility, it is easy to configure and manage the router. The web-based utility can be used on any Windows, Macintosh or UNIX OS with a web browser, such as Microsoft Internet Explorer, Mozilla Firefox or Apple Safari.

Follow the steps below to log in to your router.

- 1. Set up the TCP/IP Protocol in Obtain an IP address automatically mode on your computer.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router. The default one is admin (all lowercase) for both username and password.

Note: If the login window does not appear, please refer to FAQ.

3. 2. Configure the Router

The Quick Setup Wizard will guide you through the process to set up your router.

3. 2. 1. Standard Wireless Router Mode

1. Select the WAN Connection Type. When using the router in a hotel room or a small office, select Dynamic IP.

Note:

- If you use DSL line and you are only provided an account name and a password by your ISP, choose PPPoF.
- If you use cable TV or fiber cable, choose Dynamic IP.
- If you are provided more information such as IP address, Subnet Mask and Default Gateway, choose Static IP.
- Contact your ISP if you are not sure about the WAN connection information. You can also select Auto-Detect to let the router detect your connection type automatically.

2. In this case, we take Dynamic IP for instance. Please select to clone the mac address or not and click Next. For other connection types, please enter the parameters provided by your ISP, and then click Next.

3. Select the wireless band you want to enable. It's suggested to keep the two bands both enabled. And click Next.

4. Either customize your Wireless Network Name and Wireless Password for the 2.4GHz/5GHz wireless network or keep the default ones, and then click Next.

5. Click Save to apply the settings.

3. 2. 2. Access Point Mode

1. Select Access Point for the operation mode of the router.

2. Either customize your Wireless Network Name and Wireless Password for the 2.4GHz/5GHz wireless network or keep the default ones, and then click Next.

3. Select the LAN IP type of the router or leave the default settings Smart IP for most cases, and then click Next.

4. Click Finish to apply the settings.

3. 2. 3. Range Extender Mode

1. Select Range Extender for the operation mode of the router.

2. Click Connect to connect to the host network in the AP List page.

3. Enter the password of the host network and then either copy the Wireless Name from the host network or customize it.

4. Select the LAN IP type of the router or leave the default settings Smart IP for most cases, and then click Next.

- 5. Click Finish to apply the settings.
- 6. Relocate the router about halfway between your host netowork and the Wi-Fi dead zone. The extended network shares the same Wi-Fi password as that of your host network, but may have different wireless network name if you have customized it during the configuration.

3. 2. 4. Client Mode

1. Select Client for the operation mode of the router.

2. Click Connect to connect to the host network in the AP List page.

3. Enter the password of the host network.

4. Select the LAN IP type of the router or leave the default settings Smart IP for most cases, and then click Next.

5. Click Finish to apply the settings. Now connect your wired-only device to the router with an Ethernet cable.

3. 2. 5. Hotspot Router Mode

1. Select the WAN Connection Type. When using the router in a hotel room or a small office, select Dynamic IP. In this case, we take Dynamic IP that requires no more parameters for instance. For other connection types, please enter the parameters provided by your ISP.

2. Click Connect to connect to the public Wi-Fi in the AP List page.

3. Enter the password of the public Wi-Fi in the Password field of the Client Setting section. In the Wireless 2.4GHz/5GHz section, either customize your Local Network SSID and Wireless Password for the 2.4GHz/5GHz network or keep the default ones, and then click Next.

4. Click Finish to apply the settings.

Chapter 4

Configure the Router in Wireless Router Mode

This chapter presents how to configure the various features of the router working as a standard wireless router.

It contains the following sections:

- Status
- Network
- Wireless
- Guest Network
- DHCP
- USB Settings
- Port Forwarding
- Security
- Parental Controls

- Access Control
- Advanced Routing
- Bandwidth Control
- IP&MAC Binding
- Dynamic DNS
- <u>IPv6</u>
- System Tools
- Log Out

4. 1. Status

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Status. You can view the current status information of the router.

- Firmware Version The version information of the router's firmware.
- Hardware Version The version information of the router's hardware.
- LAN This field displays the current settings of the LAN, and you can configure them on the Network > LAN page.
 - MAC Address The physical address of the router.

- IP Address The LAN IP address of the router.
- Subnet Mask The subnet mask associated with the LAN IP address.
- Wireless 2.4GHz/5GHz This field displays the basic information or status of the wireless function, and you can configure them on the Wireless 2.4GHz/5GHz > Basic Settings page.
 - Operation Mode The current operation mode of the router.
 - Wireless Radio Indicates whether the wireless feature is enabled or not.
 - Name (SSID) The SSID of the network.
 - Mode The current wireless working mode in use.
 - Channel Width The current wireless channel width in use.
 - Channel The current wireless channel in use.
 - MAC Address The physical address of the router.
- WAN This field displays the current settings of the WAN, and you can configure them on the Network > WAN page.
 - MAC Address The physical address of the WAN port.
 - IP Address The current WAN (Internet) IP Address. This field will be blank or 0.0.0.0 if the IP Address is assigned dynamically and there is no internet connection.
 - Subnet Mask The subnet mask associated with the WAN IP Address.
 - Default Gateway The Gateway currently used is shown here. When you use
 Dynamic IP as the internet connection type.
 - DNS Server The IP addresses of DNS (Domain Name System) server.
- System Up Time The length of the time since the router was last powered on or reset.

Click Refresh to get the latest status and settings of the router.

4. 2. Network

4. 2. 1. WAN

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Network > WAN.
- 3. Configure the IP parameters of the LAN and click Save.

Dynamic IP

If your ISP provides the DHCP service, please select Dynamic IP, and the router will automatically get IP parameters from your ISP.

Click Renew to renew the IP parameters from your ISP. Click Release to release the IP parameters.

- MTU(Bytes) The normal MTU (Maximum Transmission Unit) value for most Ethernet networks is 1500 Bytes. It is not recommended that you change the default MTU size unless required by your ISP.
- IGMP Proxy Select to enable the IGMP Proxy feature if the IPTV service provided by the ISP is IGMP technology-based.
- Get IP with Unicast DHCP A few ISPs' DHCP servers do not support the broadcast applications. If you cannot get the IP address normally, you can choose this option. (It is rarely required.)
- Set DNS server manually If your ISP provides you one or two DNS addresses, select Set DNS server manually and enter the primary and secondary addresses. Otherwise, the DNS servers will be assigned dynamically from your ISP.
- Host Name This option specifies the name of the router.

Static IP

If your ISP provides a static or fixed IP address, subnet mask, default gateway and DNS setting, please select Static IP.

- IP Address Enter the IP address in dotted-decimal notation provided by your ISP.
- Subnet Mask Enter the subnet mask in dotted-decimal notation provided by your ISP. Normally 255.255.255.0 is used as the subnet mask.
- Gateway Enter the gateway IP address in dotted-decimal notation provided by your ISP.
- Primary/Secondary DNS Server (Optional) Enter one or two DNS addresses in dotted-decimal notation provided by your ISP.
- MTU(Bytes) The normal MTU (Maximum Transmission Unit) value for most Ethernet networks is 1500 Bytes. It is not recommended that you change the default MTU size unless required by your ISP.
- IGMP Proxy Select to enable the IGMP Proxy feature if the IPTV service provided by the ISP is IGMP techonology-based.

PPPoE/Russia PPPoE

If your ISP provides PPPoE connection, select PPPoE/Russia PPPoE.

- PPP Username/Password Enter the username and password provided by your ISP.
 These fields are case-sensitive.
- Confirm Password Enter the Password provided by your ISP again to ensure the password you entered is correct.
- Secondary Connection It's available only for PPPoE connection. If your ISP provides an extra connection type, select Dynamic IP or Static IP to activate the secondary connection.
- Connection Mode
 - Always On Connect automatically after the router is connected.
 - Connect on demand In this mode, the internet connection can be terminated
 automatically after a specified inactivity period (Max Idle Time) and be reestablished when you attempt to access the internet again. If you want to keep
 your internet connection active all the time, please enter 0 in the Max Idle Time
 field. Otherwise, enter the number of minutes you want to have elapsed before
 your internet access disconnects.
 - Connect manually You can click Connect/Disconnect to connect/disconnect immediately. This mode also supports the Max Idle Time function as Connect on demand mode. The internet connection can be disconnected automatically after a specified inactivity period (Max Idle Time) and not be able to re-establish when you attempt to access the internet again.

Note

- Only when you have configured the system time on the System Tools > Time Settings page, will the time-based connecting function take effect.
- Sometimes the connection cannot be terminated although you have specified the Max Idle Time because some applications are visiting the internet continually in the background.

If you want to do some advanced configurations, please click Advanced.

- Service Name/Server Name The service name and server name should not be configured unless you are sure it is necessary for your ISP. In most cases, leaving these fields blank will work.
- MTU(Bytes)- The default MTU size is 1480 bytes. It is not recommended that you change the default MTU size unless required by your ISP.

- IGMP Proxy Select to enable the IGMP Proxy feature if the IPTV service provided by the ISP is IGMP technology-based.
- Use IP address specified by ISP If your ISP does not automatically assign IP addresses
 to the router, please select Use IP address specified by ISP and enter the IP address
 provided by your ISP in dotted-decimal notation.
- Set DNS server manually If your ISP does not automatically assign DNS addresses to the router, please select Set DNS server manually and enter the IP address in dotteddecimal notation of your ISP's primary DNS server. If a secondary DNS server address is available, enter it as well.

BigPond Cable

If your ISP provides BigPond cable connection, please select BigPond Cable.

- Username/Password Enter the username and password provided by your ISP. These fields are case-sensitive.
- Auth Server Enter the authenticating server IP address or host name.
- Auth Domain Type in the domain suffix server name based on your location.
- MTU(Bytes) The default MTU size is 1480 bytes. It is not recommended that you change the default MTU size unless required by your ISP.
- IGMP Proxy Select to enable the IGMP Proxy feature if the IPTV service provided by the ISP is IGMP technology-based.
- Connection Mode
 - Always On Connect automatically after the router is connected.
 - Connect on demand In this mode, the internet connection can be terminated automatically after a specified inactivity period (Max Idle Time) and be reestablished when you attempt to access the internet again. If you want to keep

- your internet connection active all the time, please enter 0 in the Max Idle Time field. Otherwise, enter the number of minutes you want to have elapsed before your internet access disconnects.
- Connect manually You can click Connect/Disconnect to connect/disconnect immediately. This mode also supports the Max Idle Time function as Connect on demand mode. The internet connection can be disconnected automatically after a specified inactivity period (Max Idle Time) and not be able to re-establish when you attempt to access the internet again.
- Note: Sometimes the connection cannot be terminated although you have specified the Max Idle Time because some applications are visiting the internet continually in the background.

L2TP

If your ISP provides L2TP connection, please select L2TP.

- Username/Password Enter the username and password provided by your ISP. These fields are case-sensitive.
- Confirm Password Enter the Password provided by your ISP again to ensure the password you entered is correct.
- Connect/Disconnect Click this button to connect or disconnect immediately.
- Addressing Type Select either as required by your ISP. If Static IP is selected, please enter the IP address, subnet marsk, gateway and DNS also provided by your ISP.
- Internet IP Address/ Internet DNS The internet IP address and DNS server address assigned by L2TP server.

- MTU(Bytes) The default MTU size is 1480 bytes. It is not recommended that you change the default MTU size unless required by your ISP.
- IGMP Proxy Select to enable the IGMP Proxy feature if the IPTV service provided by the ISP is IGMP technology-based.
- Connection Mode
 - Always On Connect automatically after the router is connected.
 - Connect on demand In this mode, the internet connection can be terminated
 automatically after a specified inactivity period (Max Idle Time) and be reestablished when you attempt to access the internet again. If you want to keep
 your internet connection active all the time, please enter 0 in the Max Idle Time
 field. Otherwise, enter the number of minutes you want to have elapsed before
 your internet access disconnects.
 - Connect manually You can click Connect/Disconnect to connect/disconnect immediately. This mode also supports the Max Idle Time function as Connect on demand mode. The internet connection can be disconnected automatically after a specified inactivity period (Max Idle Time) and not be able to re-establish when you attempt to access the internet again.

Note: Sometimes the connection cannot be terminated although you have specified the Max Idle Time because some applications are visiting the internet continually in the background.

PPTP

If your ISP provides PPTP connection, please select PPTP.

- Username/Password Enter the username and password provided by your ISP. These fields are case-sensitive.
- Confirm Password Enter the Password provided by your ISP again to ensure the password you entered is correct.
- Connect/Disconnect Click this button to connect or disconnect immediately.
- Addressing Type Select either as required by your ISP. If Static IP is selected, please enter the IP address, subnet marsk, gateway and DNS also provided by your ISP.
- Internet IP Address/ Internet DNS The internet IP address and DNS server address assigned by L2TP server.
- MTU(Bytes) The default MTU size is 1480 bytes. It is not recommended that you change the default MTU size unless required by your ISP.
- IGMP Proxy Select to enable the IGMP Proxy feature if the IPTV service provided by the ISP is IGMP technology-based.
- Connection Mode
 - Always On Connect automatically after the router is connected.
 - Connect on demand In this mode, the internet connection can be terminated automatically after a specified inactivity period (Max Idle Time) and be reestablished when you attempt to access the internet again. If you want to keep your internet connection active all the time, please enter 0 in the Max Idle Time field. Otherwise, enter the number of minutes you want to have elapsed before your internet access disconnects.
 - Connect manually You can click Connect/Disconnect to connect/disconnect immediately. This mode also supports the Max Idle Time function as Connect on demand mode. The internet connection can be disconnected automatically after a specified inactivity period (Max Idle Time) and not be able to re-establish when you attempt to access the internet again.

Note: Sometimes the connection cannot be terminated although you have specified the Max Idle Time because some applications are visiting the internet continually in the background.

4. 2. 2. 3G/4G Settings

To use the 3G/4G function, you should first insert a 3G/4G USB modem into the 3G/4G USB port of the router. There is already much 3G/4G USB modem information embedded in th router. The USB modem parameters will be set automatically if the SIM/UIM card is supported by the router.

Note: 3G/4G modem is only supported in some regions.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Network > 3G/4G Settings.

- Location Please select the location where you are enjoying the 3G/4G service.
- Mobile ISP Please select the ISP providing the 3G/4G service. The router will automatically fill in the default Dial Number and APN of that ISP.
- Username/Password Enter the username and password provided by your ISP if any.
- Authentication Type Some ISPs require authentication to access the internet. Please select Auto or consult your ISP.
 - Auto The router will have dynamic negotiation with the dialing server and the authentication type doesn't need to be specified.
 - PAP Password Authentication Protocol. Select PAS if required by your ISP.
 - CHAP Challenge Handshake Authentication Protocol. Select CHAP if required by your ISP.

Click Advance to set advanced options.

- MTU size (in bytes) The typical MTU (Maximum Transmission Unit) size for 3G or 4G network is 1480 Bytes.
- Echo request interval Enter a time interval value between 0 and 120 (in seconds) for which the router requests Access Concentrator to echo at every interval. The default value is 30. 0 means no detection.

- Use the following IP Address Select this option and enter the IP address provided by your ISP.
- Use the Following DNS Servers Select this checkbox and enter the DNS server address(es) in dotted decimal notation provided by your ISP. This 3G/4G connection will only use the specified DNS server(s).

If your 3G/4G USB modem cannot be identified by the router, please follow the steps below to have furtuer configuration.

- 1. Download a most recent 3G/4G USB modem configuration file from our website www.tp-link.com.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to Network > 3G/4G Settings > Modem Settings.
- 4. Click Add New.

5. Click Choose File to locate the file you have downloaded and then click Upload.

4. 2. 3. LAN

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Network > LAN.
- 3. Configure the IP parameters of the LAN and click Save.

- MAC Address The physical address of the LAN ports. The value can not be changed.
- IP Address Enter the IP address in dotted-decimal notation of your router (factory default 192.168.0.254).
- Subnet Mask An address code that determines the size of the network. Normally 255,255,255.0 is used as the subnet mask.
- IGMP Snooping The IGMP Snooping feature allows the router to only forward multicast traffic to ports that have requested them.

Note:

- If you have changed the IP address, you must use the new IP address to log in.
- If the new IP address you set is not in the same subnet as the old one, the IP address pool in the DHCP Server will be configured automatically, but the Virtual Server and DMZ Host will not take effect until they are re-configured.

4. 2. 4. MAC Clone

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Network > MAC Clone.
- 3. Configure the WAN MAC address and click Save.

- WAN MAC Address This field displays the current MAC address of the WAN port.
 If your ISP requires you to register the MAC address, please enter the correct MAC address in this field. Click Restore Factory MAC to restore the MAC address of WAN port to the factory default value.
- Your PC's MAC Address This field displays the MAC address of the PC that is managing the router. If the MAC address is required, you can click Clone MAC Address and this MAC address will be filled in the WAN MAC Address field.

Note:

- You can only use the MAC Address Clone function for PCs on the LAN.
- If you have changed the WAN MAC address when the WAN connection is PPPoE, it will not take effect until the connection is re-established.

4.3. Wireless

4. 3. 1. Basic Settings

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Basic Settings.
- 3. Configure the basic settings for the 2.4GHz/5GHz wireless network and click Save.

- Wireless Network Name Enter a string of up to 32 characters. The default SSID is TP-Link_XXXX (XXXX indicates the last unique four numbers of each router's MAC address). It is strongly recommended that you change your network name (SSID). This value is case-sensitive. For example, TEST is NOT the same as test.
- Mode Select the desired mode. It is strongly recommended that you keep the default setting 11bgn mixed or 11a/n/ac mixed.
- Channel Width Select any channel width from the drop-down list. The default setting is Auto, which can automatically adjust the channel width for your clients.
- Channel This field determines which operating frequency will be used. The default channel is set to Auto. It is not necessary to change the wireless channel unless you notice interference problems with another nearby access point.
- Enable SSID Broadcast If enabled, the router will broadcast the wireless network name (SSID).

4. 3. 2. WPS

WPS (Wi-Fi Protected Setup) can help you to quickly and securely connect to a network. This section will guide you to add a new wireless device to your router's network quickly via WPS.

Note: The WPS function cannot be configured if the wireless function of the router is disabled. Please make sure the wireless function is enabled before configuration.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > WPS.
- 3. Follow one of the following three methods to connect your client device to the router's Wi-Fi network.

Method ONE: Press the WPS Button on Your Client Device

1. Keep the WPS Status as Enabled and click Add device.

2. Select Press the button of the new device in two minutes and click Connect.

- 3. Within two minutes, press the WPS button on your client device.
- 4. A success message will appear on the WPS page if the client device has been successfully added to the router's network.

Method TWO: Enter the Client's PIN

1. Keep the WPS Status as Enabled and click Add device.

2. Select Enter new device PIN, enter your client device's current PIN in the PIN filed and click Connect.

3. A success message will appear on the WPS page if the client device has been successfully added to the router's network.

Method Three: Enter the Router's PIN

1. Keep the WPS Status as Enabled and get the Current PIN of the router.

2. Enter the router's current PIN on your client device to join the router's Wi-Fi network.

4. 3. 3. Wireless Security

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Wireless Security.
- 3. Configure the security settings of your 2.4GHz/5GHz wireless network and click Save.

- Disable Wireless Security The wireless security function can be enabled or disabled. If disabled, wireless clients can connect to the router without a password. It's strongly recommended to choose one of the following modes to enable security.
- WPA/WPA2-Personal It's the WPA/WPA2 authentication type based on pre-shared passphrase.
 - Version Select Auto, WPA-PSK or WPA2-PSK.
 - Encryption Select Auto, TKIP or AES.
 - Wireless Password Enter ASCII or Hexadecimal characters. For Hexadecimal, the length should be between 8 and 64 characters; for ASCII, the length should be between 8 and 63 characters.
 - Group Key Update Period Specify the group key update interval in seconds. The value can be 0 or at least 30. Enter 0 to disable the update.
- WPA/WPA2-Enterprise It's based on Radius Server.
 - Version Select Auto, WPA or WPA2.
 - Encryption Select Auto, TKIP or AES.
 - Radius Server IP Enter the IP address of the Radius server.
 - Radius Port Enter the port that Radius server used.
 - Radius Password Enter the password for the Radius server.
 - Group Key Update Period Specify the group key update interval in seconds. The value should be 30 or above. Enter 0 to disable the update.
- WEP It is based on the IEEE 802.11 standard.

- Type The default setting is Auto, which can select Shared Key or Open System authentication type automatically based on the wireless client's capability and request.
- WEP Key Format Hexadecimal and ASCII formats are provided here.
 Hexadecimal format stands for any combination of hexadecimal digits (0-9, a-f, A-F) in the specified length. ASCII format stands for any combination of keyboard characters in the specified length.
- WEP Key (Password) Select which of the four keys will be used and enter the matching WEP key. Make sure these values are identical on all wireless clients in your network.
- Key Type Select the WEP key length (64-bit, 128-bit or 152-bit) for encryption.
 Disabled means this WEP key entry is invalid.
- 64-bit Enter 10 hexadecimal digits (any combination of 0-9, a-f and A-F. Null key is not permitted) or 5 ASCII characters.
- 128-bit Enter 26 hexadecimal digits (any combination of 0-9, a-f and A-F. Null key is not permitted) or 13 ASCII characters.
- 152-bit Enter 32 hexadecimal digits (any combination of 0-9, a-f and A-F. Null key is not permitted) or 16 ASCII characters.

4. 3. 4. Wireless MAC Filtering

Wireless MAC Filtering is used to deny or allow specific wireless client devices to access your network by their MAC addresses.

I want to:

Deny or allow specific wireless client devices to access my network by their MAC addresses.

For example, you want the wireless client A with the MAC address 00:0A:EB:B0:00:0B and the wireless client B with the MAC address 00:0A:EB:00:07:5F to access the router, but other wireless clients cannot access the router.

How can I do that?

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Wireless MAC Filtering.
- 3. Click Enable to enable the Wireless MAC Filtering function.
- **4.** Select Allow the stations specified by any enabled entries in the list to access as the filtering rule.
- 5. Delete or disable all entries if there are any entries already.

6. Click Add New and fill in the blanks.

- 1) Enter the MAC address 00:0A:EB:B0:00:0B/00:0A:EB:00:07:5F in the MAC Address field.
- 2) Enter Client A/B in the Description field.
- 3) Leave the status as Enabled.
- 4) Click Save and click Back.
- 7. The configured filtering rules should be listed as the picture shows below.

Done! Now only client A and client B can access your network.

4. 3. 5. Wireless Advanced

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Wireless Advanced.
- 3. Configure the advanced settings of your wireless network and click Save.
- Note: If you are not familiar with the setting items on this page, it's strongly recommended to keep the provided default values; otherwise it may result in lower wireless network performance.

- Transmit Power Select High, Middle or Low which you would like to specify for the router. High is the default setting and recommended.
- Beacon Interval Enter a value between 40-1000 milliseconds for Beacon Interval here. Beacon Interval value determines the time interval of the beacons. The beacons are the packets sent by the router to synchronize a wireless network. The default value is 100.
- RTS Threshold Here you can specify the RTS (Request to Send) Threshold. If the
 packet is larger than the specified RTS Threshold size, the router will send RTS frames
 to a particular receiving station and negotiate the sending of a data frame. The default
 value is 2346.
- Fragmentation Threshold This value is the maximum size determining whether
 packets will be fragmented. Setting a low value for the Fragmentation Threshold may
 result in poor network performance because of excessive packets. 2346 is the default
 setting and is recommended.
- DTIM Interval This value determines the interval of the Delivery Traffic Indication Message (DTIM). A DTIM field is a countdown field informing clients of the next window for listening to broadcast and multicast messages. When the router has buffered broadcast or multicast messages for associated clients, it sends the next DTIM with a DTIM Interval value. You can specify the value between 1-255 Beacon Intervals. The default value is 1, which indicates the DTIM Interval is the same as Beacon Interval.
- Enable Short GI It is recommended to enable this function, for it will increase the data capacity by reducing the guard interval time.
- Enable Client Isolation This function isolates all connected wireless stations so that wireless stations cannot access each other through WLAN. This function will be disabled if WDS/Bridge is enabled.
- Enable WMM WMM function can guarantee the packets with high-priority messages being transmitted preferentially. It is strongly recommended to enable this function.

4. 3. 6. Wireless Statistics

- Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Wireless Statistics to check the data packets sent and received by each client device connected to the router.

- MAC Address The MAC address of the connected wireless client.
- Current Status The running status of the connected wireless client.
- Received Packets Packets received by the wireless client.
- Sent Packets Packets sent by the wireless client.
- SSID SSID that the wireless client is connected to.

4. 4. Guest Network

Guest Network allows you to provide Wi-Fi access for guests without disclosing your main network. When you have guests in your home, apartment, or workplace, you can create a guest network for them.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Guest Network.

 Allow Guests To Access My Local Network - If enabled, guests can communicate with hosts.

- Guest Network Isolation If enabled, one guest can not communicate with another.
- Guest Network Bandwidth Control If enabled, the Guest Network Bandwidth Control rules will take effect.
- Band Select Select the wireless band 2.4GHz or 5GHz for the guest network.
- Guest Network Enable or disable the guest network.
- Network Name Enter a value of up to 32 characters. The same Name(SSID) must be assigned to all wireless devices in your guest network.
- Max Guests number Maximum guests (1-32).
- Security You can configure the security of the guest network here.
- Access Time You can also specify when or how long a guest device can access the internet.
 - Schedule During this time the wireless stations could not access the guest network.

Timeout - If the countdown timer hits zero, the guest network will be closed.

4. 5. DHCP

By default, the DHCP (Dynamic Host Configuration Protocol) Server is enabled and the router acts as a DHCP server; it dynamically assigns TCP/IP parameters to client devices from the IP Address Pool. You can change the settings of DHCP Server if necessary, and you can reserve LAN IP addresses for specified client devices.

4. 5. 1. DHCP Settings

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to DHCP > DHCP Settings.
- 3. Specify DHCP server settings and click Save.

- DHCP Server Enable or disable the DHCP server. If disabled, you must have another DHCP server within your network or else you must configure the computer manually.
- Start IP Address Specify an IP address for the DHCP Server to start with when assigning IP addresses. 192.168.0.100 is the default start address.
- End IP Address Specify an IP address for the DHCP Server to end with when assigning IP addresses. 192.168.0.199 is the default end address.
- Lease Time The Address Lease Time is the amount of time a network user will be allowed to connect to the router with the current dynamic IP Address. When time is up, the router will automatically assign the same IP address to the user. The range of the time is 1 ~ 2880 minutes. The default value is 120.
- Default Gateway (Optional) It is suggested to input the IP address of the LAN port of the Router. The default value is 192.168.0.254.
- Default Domain (Optional) Input the domain name of your network.
- Primary DNS (Optional) Input the DNS IP address provided by your ISP.
- Secondary DNS (Optional) Input the IP address of another DNS server if your ISP provides two DNS servers.

Note: To use the DHCP server function of the router, you must configure all computers on the LAN as Obtain an IP Address automatically.

4. 5. 2. DHCP Client List

1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.

2. Go to DHCP > DHCP Client List to view the information of the clients connected to the router.

- Client Name The name of the DHCP client.
- MAC Address The MAC address of the DHCP client.
- Assigned IP The IP address that the router has allocated to the DHCP client.
- Lease Time The time of the DHCP client leased. After the dynamic IP address has expired, a new dynamic IP address will be automatically assigned to the user.

You cannot change any of the values on this page. To update this page and show the current connected devices, click Refresh.

4. 5. 3. Address Reservation

You can reserve an IP address for a specific client. When you have specified a reserved IP address for a PC on the LAN, this PC will always receive the same IP address each time when it accesses the DHCP server.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to DHCP > Address Reservation.
- 3. Click Add New and fill in the blanks.

- 1) Enter the MAC address (in XX:XX:XX:XX:XX format) of the client for which you want to reserve an IP address.
- 2) Enter the IP address (in dotted-decimal notation) which you want to reserve for the client.
- 3) Leave the status as Enabled.

4) Click Save.

4. 6. USB Settings

You can insert a USB drive to share files among users on the LAN, access the USB drive remotely on the internet and enjoy videos and photos stored in the USB drive.

4. 6. 1. Storage Sharing

Share your USB storage device with different users on the network.

To access the USB disk:

1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips:

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage:
 Go to USB Settings > USB Mass Storage and click Disconnect.

2. Access Your USB Disk

By default, all the network clients can access your USB disk. Refer to the following table for access instructions. You can customize user accounts by referring to <u>User Accounts</u>.

- To customize your settings:
- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > Storage Sharing.

- Server Status the Storage Sharing's current status.
- Anonymous access to all volumes This function is enabled by default, so users can access all activated volumes of Storage Sharing without accounts. If you want to add

a shared folder which does not allow anonymous login, uncheck the box to disable this function. And Folder Table will be displayed as shown below.

- Share Name This folder's display name.
- Directory The real full path of the specified folder.
- User Access The authorization of the user is displayed. * users mean Super Users
 who have the full-access permission to all activated volumes and share folders. Grey
 users mean the users who have no right to use this function. Others are common
 users.
- Status The status of the entry is enabled or disabled.
- Edit Click Edit in the table, and then you can modify the entry.

4. 6. 2. FTP Server

You can share specific folders on you USB drive on the LAN or access your USB drive outside the local area network.

For example:

- Only share specific folders with clients on the LAN.
- Share photos and other large files with your friends without logging in to (and paying for) a photo-sharing site or email system.
- Get a safe backup for the material for a presentation.
- To set up your FTP server:

- 1. Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to USB Settings > FTP Server.
- 4. Click Enable to enable the FTP Server.
- 5. Click Enable to enable the internet access to the FTP server.
- 6. Specify a port number for the Service Port. The default value is 21.
- 7. Click Apply.
- To specify a folder to be accessed via the FTP server:

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > FTP Server.
- 3. Click Add New Folder.
- 4. Specify a name for the folder to be shared in the Share Name field. And select the folder you want to share. And determine the access right of user accounts.

- 5. Click Apply.
- 6. You can check which folder is shared and also edit or delete the folder.

- To access the USB disk locally:
- 1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips:

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage:
 Go to USB Settings > USB Mass Storage and click Disconnect.
- 2. Access Your USB Disk Locally

Refer to the following table for access instructions. You can customize user accounts by referring to User Accounts.

To access the USB disk remotely:

Refer to the following table for access instructions. You can customize user accounts by referring to <u>User Accounts</u>.

4. 6. 3. Media Server

The Media Server feature allows to view photos, play music and watch movies on the USB drive directly with DLNA-supported devices, such as on your computer, pad and PS2/3/4.

- To share specific folders:
- 1. Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to USB Settings > Media Server.
- 4. Click Enable to enable the Media Server.

5. Click Add New Folder. Specify a name for the folder to be shared in the Share Name field. And select the folder you want to share.

6. Click Apply.

- To access the USB disk:
- 1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips:

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage: Go to USB Settings > USB Mass Storage and click Disconnect.
- 2. Access the Media Files on Your USB Disk

Now the DLNA-supported devices (such as your computer and pad) connected to the router can detect and play the media files on the USB disk.

4. 6. 4. User Accounts

You can specify the username and password for Storage Sharing and FTP Server access.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > User Accounts.
- 3. Choose the Index for the account and specify a new username and password in the New Username and New Password fields, and reenter the password for confirmation.
- Note: For an account with Index 1, it is the Super User with full access to all active volumes and shared folders.

4. Click Set.

The paper discuss to configure and a Lorent by Design Design Private Plants And Set to consider a principal paper design.

The paper discuss to configure and a Lorent by Design Configure and Andrew Design Configure and Andrew

5. You can check the newly added account and also edit or delete the account.

4. 7. Port Forwarding

The router's NAT (Network Address Translation) feature makes the devices on the LAN use the same public IP address to communicate in the internet, which protects the local network by hiding IP addresses of the devices. However, it also brings about the problem that external hosts cannot initiatively communicate with the specified devices in the local network.

With the forwarding feature, the router can traverse the isolation of NAT so that clients on the internet can reach devices on the LAN and realize some specific functions.

The TP-Link router includes four forwarding rules. If two or more rules are set, the priority of implementation from high to low is Virtual Servers, Port Triggering, UPNP and DMZ.

4. 7. 1. Virtual Servers

When you build up a server in the local network and want to share it on the internet, Virtual Servers can realize the service and provide it to internet users. At the same time virtual servers can keep the local network safe as other services are still invisible from the internet.

Virtual Servers can be used to set up public services in your local network, such as HTTP, FTP, DNS, POP3/SMTP and Telnet. Different service uses different service port. Port 80 is used in HTTP service, port 21 in FTP service, port 25 in SMTP service and port 110 in POP3 service. Please verify the service port number before the configuration.

I want to:

Share my personal website I've built in local network with my friends through the internet.

For example, the personal website has been built in my home PC (192.168.0.100). I hope that my friends on the internet can visit my website in some way. My PC is connected to the router with the WAN IP address 218.18.232.154.

How can I do that?

- 1. Set your PC to a static IP address, for example 192.168.0.100.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to Forwarding > Virtual Servers.
- **4.** Click Add New. Select HTTP from the Common Service Port list. The service port, internal port and protocol will be automatically filled in. Enter the PC's IP address 192.168.0.100 in the IP Address field.

5. Leave the status as Enabled and click Save.

Note:

- It is recommended to keep the default settings of Internal Port and Protocol if you are not clear about which port and protocol to use.
- If the service you want to use is not in the Common Service Port list, you can enter the corresponding parameters manually. You should verify the port number that the service needs.
- You can add multiple virtual server rules if you want to provide several services in a router. Please note that the Service Port should not be overlapped.

Done!

Users on the internet can enter http:// WAN IP (in this example: http:// 218.18.232.154) to visit your personal website.

Note:

- If you have changed the default Service Port, you should use http:// WAN IP: Service Port to visit the
 website.
- Some specific service ports are forbidden by the ISP, if you fail to visit the website, please use another service port.

4. 7. 2. Port Triggering

Port triggering can specify a triggering port and its corresponding external ports. When a host in the local network initiates a connection to the triggering port, all the external ports will be opened for subsequent connections. The router can record the IP address of the host. When the data from the internet return to the external ports, the router can forward them to the corresponding host. Port triggering is mainly applied to online games, VoIPs, video players and common applications including MSN Gaming Zone, Dialpad, Quick Time 4 players and more.

Follow the steps below to configure the port triggering rules:

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Forwarding > Port Triggering.
- 3. Click Add New. Select the desired application from the Common Applications list. The trigger port amd incoming ports will be automatically filled in. The following picture takes application MSN Gaming Zone as an example.

4. Leave the status as Enabled and click Save.

Note:

- You can add multiple port triggering rules as needed.
- The triggering ports can not be overlapped.
- If the application you need is not listed in the Common Applications list, please enter the parameters manually. You should verify the incoming ports the application uses first and enter them in Incoming Ports field. You can input at most 5 groups of ports (or port sections). Every group of ports must be set apart with ",". For example, 2000-2038, 2050-2051, 2085, 3010-3030.

4. 7. 3. DMZ

When a PC is set to be a DMZ (Demilitarized Zone) host in the local network, it is totally exposed to the internet, which can realize the unlimited bidirectional communication between internal hosts and external hosts. The DMZ host becomes a virtual server with all ports opened. When you are not clear about which ports to open in some special applications, such as IP camera and database software, you can set the PC to be a DMZ host.

Note: DMZ is more applicable in the situation that users are not clear about which ports to open. When it is enabled, the DMZ host is totally exposed to the internet, which may bring some potential safety hazards. If DMZ is not in use, please disable it in time.

I want to:

Make the home PC join the internet online game without port restriction.

For example, due to some port restriction, when playing the online games, you can log in normally but cannot join a team with other players. To solve this problem, set your PC as a DMZ host with all ports opened.

How can I do that?

- 1. Assign a static IP address to your PC, for example 192.168.0.100.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to Forwarding > DMZ.
- **4.** Select Enable and enter the IP address 192.168.0.100 in the DMZ Host IP Address filed.

5. Click Save.

Done!

You've set your PC to a DMZ host and now you can make a team to game with other players.

4. 7. 4. UPnP

The UPnP (Universal Plug and Play) protocol allows the applications or host devices to automatically find the front-end NAT device and send request to it to open the corresponding ports. With UPnP enabled, the applications or host devices on the local network and the internet can freely communicate with each other realizing the seamless connection of the network. You may need to enable the UPnP if you want to use applications for multiplayer gaming, peer-to-peer connections, real-time communication (such as VoIP or telephone conference) or remote assistance, etc.

Tips:

• UPnP is enabled by default in this router.

- Only the application supporting UPnP protocol can use this feature.
- UPnP feature needs the support of operating system (e.g. Windows Vista/ Windows 7/ Windows 8, etc. Some of operating system need to install the UPnP components).

For example, when you connect your Xbox to the router which is connected to the internet to play online games, UPnP will send request to the router to open the corresponding ports allowing the following data penetrating the NAT to transmit. Therefore, you can play Xbox online games without a hitch.

If necessary, you can follow the steps to change the status of UPnP.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Forwarding > UPnP.
- 3. Click Disable or Enable according to your needs.

4. 8. Security

This function allows you to protect your home network from cyber attacks and unauthorized users by implementing these network security functions.

4. 8. 1. Basic Security

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Security > Basic Security, and you can enable or disable the security functions.

- Firewall A firewall protects your network from internet attacks.
 - SPI Firewall SPI (Stateful Packet Inspection, also known as dynamic packet filtering) helps to prevent cyber attacks by tracking more state per session. It validates that the traffic passing through the session conforms to the protocol. SPI Firewall is enabled by default.
- VPN VPN Passthrough must be enabled if you want to allow VPN tunnels using IPSec,
 PPTP or L2TP protocols to pass through the router's firewall.
 - PPTP Passthrough Point-to-Point Tunneling Protocol (PPTP) allows the Point-to-Point Protocol (PPP) to be tunneled through an IP network. If you want to allow PPTP tunnels to pass through the router, you can keep the default (Enabled).
 - L2TP Passthrough Layer 2 Tunneling Protocol (L2TP) is the method used to enable Point-to-Point sessions via the internet on the Layer 2 level. If you want to allow L2TP tunnels to pass through the router, you can keep the default (Enabled).
 - IPSec Passthrough Internet Protocol Security (IPSec) is a suite of protocols for ensuring private, secure communications over Internet Protocol (IP) networks, through the use of cryptographic security services. If you want to allow IPSec tunnels to pass through the router, you can keep the default (Enabled).
- ALG It is recommended to enable Application Layer Gateway (ALG) because ALG allows customized Network Address Translation (NAT) traversal filters to be plugged

into the gateway to support address and port translation for certain application layer "control/data" protocols such as FTP, TFTP, H323 etc.

- FTP ALG To allow FTP clients and servers to transfer data across NAT, keep the default Enable.
- TFTP ALG To allow TFTP clients and servers to transfer data across NAT, keep the default Enable.
- H323 ALG To allow Microsoft NetMeeting clients to communicate across NAT, keep the default Enable.
- SIP ALG To allow some multimedia clients to communicate across NAT, click Enable.
- RTSP ALG To allow some media player clients to communicate with some streaming media servers across NAT, click Enable.
- 3. Click Save.

4. 8. 2. Advanced Security

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Security > Advanced Security, and you can protect the router from being attacked by ICMP-Flood, UDP Flood and TCP-SYN Flood.

- DoS Protection Denial of Service protection. Select Enable or Disable to enable or disable the DoS protection function. Only when it is enabled, will the flood filters be enabled.
- Note: Dos Protection will take effect only when the Statistics in System Tool > Statistics is enabled.
- Enable ICMP-FLOOD Attack Filtering Check the box to enable or disable this function.

- ICMP-FLOOD Packets Threshold (5~3600) The default value is 50. Enter a value between 5 ~ 3600. When the number of the current ICMP-FLOOD packets is beyond the set value, the router will startup the blocking function immediately.
- Enable UDP-FLOOD Filtering Check the box to enable or disable this function.
- UDP-FLOOD Packets Threshold (5~3600) The default value is 500. Enter a value between 5 ~ 3600. When the number of the current UPD-FLOOD packets is beyond the set value, the router will startup the blocking function immediately.
- Enable TCP-SYN-FLOOD Attack Filtering -Check the box to enable or disable this function.
- TCP-SYN-FLOOD Packets Threshold (5~3600) The default value is 50. Enter a value between 5 ~ 3600. When the number of the current TCP-SYN-FLOOD packets is beyond the set value, the router will startup the blocking function immediately.
- Forbid Ping Packet From WAN Port The default setting is disabled. If enabled, the ping packet from the internet cannot access the router.
- Forbid Ping Packet From LAN Port The default setting is disabled. If enabled, the ping packet from LAN cannot access the router. This function can be used to defend against some viruses.
- 3. Click Save.
- 4. Click Blocked DoS Host List to display the DoS host table by blocking.

4. 8. 3. Local Management

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Security > Local Management, and you can block computers in LAN from accessing the router.

For example, if you want to allow PCs with specific MAC addresses to access the router's web management page locally from inside the network, please follow the instructions below:

- Select Only the PCs listed can browse the built-in web pages to perform Administrator tasks.
- 2) Enter the MAC address of each PC separately. The format of the MAC address is XX:XX:XX:XX:XX:XX (X is any hexadecimal digit). Only the PCs with the listed MAC addresses can use the password to browse the built-in web pages to perform administrator tasks.
- 3) Click Set, and your PC's MAC address will also be listed.
- 4) Click Save.

Note: If your PC is blocked but you want to access the router again, press and hold the Reset button to reset the router to the factory defaults.

4. 8. 4. Remote Management

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Security > Remote Management, and you can manage your router from a remote device via the internet.

- Web Management Port Web browser access normally uses the standard HTTP service port 80. This router's default remote management web port number is 80.
 For higher security, you can change the remote management web port to a custom port by entering a number between 1 and 65534 but do not use the number of any common service port.
- Remote Management IP Address This is the address you will use when accessing
 your router via a remote device. This function is disabled when the IP address is set
 to the default value of 0.0.0.0. To enable this function, change 0.0.0.0 to a valid IP
 address. If it is set to 255.255.255.255, then all the remote devices can access the
 router from the internet.

Note:

- To access the router, enter your router's WAN IP address in your browser's address bar, followed by a
 colon and the custom port number. For example, if your router's WAN address is 202.96.12.8, and the
 port number used is 8080, please enter http://202.96.12.8:8080 in your browser. Later, you may be asked
 for the router's password. After successfully entering the username and password, you will be able to
 access the router's web management page.
- Be sure to change the router's default password for security purposes.

4. 9. Parental Controls

Parental Controls allows you to block inappropriate and malicious websites, and control access to specific websites at specific time for your children's devices.

For example, you want the children's PC with the MAC address 00:11:22:33:44:AA can access www.tp-link.com on Saturday only while the parent PC with the MAC address 00:11:22:33:44:BB is without any restriction.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Parental Controls.
- 3. Select Enable Parental Controls and enter the MAC address 00:11:22:33:44:BB in the MAC Address of Parental PC field. And click Save.

4. Enter appropriate parameters in corresponding fields.

- Enter 00-11-22-33-44-BB in the MAC Address -1 field.
- Select the allowed access time.
- Enter www.tp-link.com in the Add URL field and click Add.

5. Click Save.

4. 10. Access Control

Access Control is used to deny or allow specific client devices to access your network with access time and content restrictions.

I want to:

Deny or allow specific client devices to access my network with access time and content restrictions.

For example, If you want to restrict the internet activities of host with MAC address 00:11:22:33:44:AA on the LAN to access www.tp-link.com only, please follow the steps below.

How can I do that?

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Access Control > Host and configure the host settings:

- 1) Click Add New.
- Select MAC Address as the mode type. Create a unique description (e.g. host_1) for the host in the Host Description field and enter 00:11:22:33:44:AA in the MAC Address filed.

- 3) Click Save.
- 3. Go to Access Control > Target and configure the target settings:
 - 1) Click Add New.
 - 2) Select URL Address as the mode type. Create a unique description (e.g. target_1) for the target in the Target Description field and enter the URL address, either the full name or the keywords (for example TP-Link) in the Add URL Address field and click Add.
 - Note: Any domain name with keywords in it (e.g. www.tp-link.com) will be blocked or allowed.

- 3) Click Save.
- 4. Go to Access Control > Schedule and configure the schedule settings:
 - 1) Click Add New.
 - 2) Create a unique description (e.g. schedule_1) for the schedule in the Description field and set the applied time and click Add.

- 3) Click Save.
- 5. Go to Access Control > Rule and add a new access control rule.
 - 1) Click Add New.
 - 2) Give a name for the rule in the Description field. Select host_1 from the host drop-down list; select target_1 from the target drop-down list; select schedule_1 from the schedule drop-down list.

- 3) Leave the status as Enabled as click Save.
- 6. Select Enable Internet access control to enable Access Control function.
- 7. Select Deny the packets not specified by any filtering rules to passthrough this device as the default filter rules and click Save.

Done!

Now only the specific host(s) can visit the target(s) within the scheduled time period.

4. 11. Advanced Routing

Static Routing is a form of routing that is configured manually by a network administrator or a user by adding entries into a routing table. The manually-configured routing information guides the router in forwarding data packets to the specific destination.

4. 11. 1. Static Routing List

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Advanced Routing > Static Routing.
- To add static routing entries:
- 1. Click Add New.

- 2. Enter the following information.
 - Destination IP Address The Destination IP Address is the address of the network or host that you want to assign to a static route.
 - Subnet Mask The Subnet Mask determines which portion of an IP address is the network portion, and which portion is the host portion.
 - Gateway This is the IP address of the default gateway device that allows the contact between the router and the network or host.
 - Interface It is empty by default. Please select a connection from the dropdown list if the Gateway is left empty or is not on the same network segment as LAN/WAN interface.
- 3. Select Enabled or Disabled for this entry on the Status drop-down list.
- 4. Click Save.

You can also do the following operations to modify the current settings.

Click Delete Selected to delete selected entries.

- Click Enable Selected to enable selected entries.
- Click Disable Selected to disable selected entries.

4. 11. 2. System Routing Table

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Advanced Routing > System Routing Table, and you can view all the valid route entries in use.

- Destination Network The Destination Network is the address of the network or host to which the static route is assigned.
- Subnet Mask The Subnet Mask determines which portion of an IP address is the network portion, and which portion is the host portion.
- Gateway This is the IP address of the gateway device that allows for contact between the Router and the network or host.
- Interface This interface tells you whether the Destination IP Address is on the LAN & WLAN (internal wired and wireless networks), or the WAN (Internet).
- Click Refresh to refresh the data displayed.

4. 12. Bandwidth Control

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Bandwidth Control.
- 3. Configure the bandwidth as needed and click Save.

The values you configure for the Egress Bandwidth and Ingress Bandwidth should be less than 100,000Kbps. For optimal control of the bandwidth, please select the right Line Type and consult your ISP for the total egress and ingress bandwidth.

- Enable Bandwidth Control Check this box so that the Bandwidth Control settings can take effect.
- Egress Bandwidth The upload speed through the WAN port.
- Ingress Bandwidth The download speed through the WAN port.

- Description This is the information about the rules such as address range.
- Priority Priority of Bandwidth Control rules. '1' stands for the highest priority while
 '8' stands for the lowest priority. The total Upstream/ Downstream Bandwidth is first
 allocated to guarantee all the Min Rate of Bandwidth Control rules. If there is any
 bandwidth left, it is first allocated to the rule with the highest priority, then to the rule
 with the second highest priority, and so on.
- Egress Bandwidth This field displays the max and min upload bandwidth through the WAN port. The default is 0.
- Ingress Bandwidth This field displays the max and min download bandwidth through the WAN port. The default is 0.
- Status Rule status, show whether the rule takes effect.
- Edit Choose to edit or delete an existing entry.
- To add a Bandwidth control rule:
- 1. Click Add New.
- 2. Enter the information as the figure shown below.

3. Click Save.

4. 13. IP&MAC Binding

IP & MAC Binding, namely, ARP (Address Resolution Protocol) Binding, is used to bind a network device's IP address to its MAC address. This will prevent ARP spoofing and other ARP attacks by denying network access to a device with a matching IP address in the ARP list, but with an unrecognized MAC address.

4. 13. 1. Binding Settings

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to IP & MAC Binding > Binding Settings.
- 3. Select Enable for ARP Binding.

- 4. Click Save.
- To add IP & MAC Binding entries:
- 1. Click Add New.

- 2. Enter the MAC address and IP address and select the Bind checkbox.
- 3. Click Save.
- To modify or delete an existing entry:
- 1. Find the desired entry in the table.
- 2. Click Edit or click Delete Selected.

4. 13. 2. ARP List

To manage a device, you can observe the device on the LAN by checking its MAC address and IP address on the ARP list, and you can also configure the items. This page displays the ARP list which shows all the existing IP & MAC Binding entries.

- MAC Address The MAC address of the listed computer on the LAN.
- IP Address The assigned IP address of the listed computer on the LAN.
- Status Indicates whether or not the MAC and IP addresses are bound.
- Load Selected Load selected items to the ARP list.
- Delete Selected Delete selected items.

Note: An item can not be loaded to the IP & MAC Binding list if the IP address of the item has been loaded before. Error warning will prompt as well.

4. 14. Dynamic DNS

The router offers the DDNS (Dynamic Domain Name System) feature, which allows the hosting of a website, FTP server, or e-mail server with a fixed domain name (named by yourself) and a dynamic IP address. Thus your friends can connect to your server by entering your domain name no matter what your IP address is. Before using this feature, you need to sign up for DDNS service providers such as www.comexe.cn,

www.dyndns.org, or www.noip.com. The Dynamic DNS client service provider will give you a password or key.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Dynamic DNS.

Comexe DDNS

If the dynamic DNS Service Provider you select is www.comexe.cn, the following page will appear.

To set up for DDNS, follow these instructions:

- 1. Enter the Domain Name received from your dynamic DNS service provider.
- 2. Enter the Username for your DDNS account.
- 3. Enter the Password for your DDNS account.
- 4. Click Login.
- 5. Click Save.
- Connection Status The status of the DDNS service connection is displayed here.
- Logout Click Logout to log out of the DDNS service.

Dyndns DDNS

If the dynamic DNS Service Provider you select is www.dyn.com, the following page will appear.

To set up for DDNS, follow these instructions:

- 1. Enter the Username for your DDNS account.
- 2. Enter the Password for your DDNS account.
- 3. Enter the Domain Name you received from dynamic DNS service provider here.
- 4. Click Login.
- 5. Click Save.
- Connection Status The status of the DDNS service connection is displayed here.
- Logout Click Logout to log out of the DDNS service.

No-ip DDNS

If the dynamic DNS Service Provider you select is www.noip.com, the following page will appear.

To set up for DDNS, follow these instructions:

- 1. Enter the Username for your DDNS account.
- 2. Enter the Password for your DDNS account.
- 3. Enter the Domain Name you received from dynamic DNS service provider.
- 4. Click Login.
- 5. Click Save.
- Connection Status The status of the DDNS service connection is displayed here.
- Logout Click Logout to log out of the DDNS service.

4.15. IPv6

Your ISP provides information about one of the following IPv6 internet connection types: Dynamic IPv6, Static IPv6, PPPoEv6 and Tunnel 6to4.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to IPv6 > IPv6 WAN.
- 3. Enable IPv6 and select the internet connection type provided by your ISP.
- Note: If you do not know what your internet connection type is, contact your ISP or judge according to the already known information provided by your ISP.
- 4. Fill in the blanks as required by different connection types.
 - 1) Dynamic IPv6: the router will automatically get related parameters from your ISP.

2) Static IPv6: Fill in the IPv6 address, gateway (optional) and DNS servers (optional) and click Save.

3) PPPoEv6: By default, the router uses the IPv4 account to connect to the IPv6 server. Click Advance to input further information if your ISP requires.

Note: If your ISP provides two separate accounts for the IPv4 and IPv6 connections, please untick the PPPoE same session with IPv4 connection checkbox and manually enter the username and password for the IPv6 connection.

4) Tunnel 6to4: An IPv4 connection type is a prerequisite for this connection type.

| IFv6 WAN | |
|---|---------------|
| Priede PM Comedian Type WWN Cornection: | Jumei Nod - 1 |
| | Save |

5. Configure the LAN settings. Select an Address Auto-Configuration Type to assign IPv6 addresses to the computers in your LAN. RADVD and DHCPv6 Server are provided. If RADVD is selected, it doesn't need to be configured. If DHCPv6 Server is selected, please fill in the following parameters.

| IPv6 LAN Settings | |
|---|--|
| The parameters on the LAN can be conglitted on this page will Note: Chry the desiral space and expend if sit of the constraint | non IPVs enabled |
| Gonza | Debuil |
| Address Auto-Compusion Lype | U PADVD & DECIVE Server |
| Start 10v5 Arkheix | :1 (14.11.1) |
| End IDvS Address: | : FILE (I-CLLL) |

| | |
| | Save |

- Start IPv6 Address Enter a value for the DHCPv6 server to start with when issuing IPv6 addresses.
- End IPv6 Address Enter a value for the DHCPv6 server to end with when issuing IPv6 addresses.
- Leased Time The Leased Time is the amount of time in which a network user will be allowed connection to the router with their current dynamic IPv6 address. Enter the amount of time, in hours, then the user will be leased this dynamic IPv6 address. After the dynamic IPv6 address has expired, the user will be automatically assigned a new dynamic IPv6 address. The default is 86400 seconds.
- Site Prefix Configuration Type Select a type to assign IPv6 prefix addresses to the computers in your LAN. Delegated and Static are provided.
- Note: If your IPv6 wan connection type is "Tunnel 6to4", the Site Prefix Configuration Type should be "Static" to make sure "Tunnel 6to4" works properly.
 - 1) If Delegated is selected:
 - Prefix Delegated WAN Connection Displays the WAN connection selected to assign prefix.

- 2) If Static is selected,
- Site Prefix Enter a value for the site prefix.
- Site Prefix Length Enter a value for the site prefix length.
- 6. Go to IPv6 > IPv6 Status to check whether you have successfully set up an IPv6 connection.

4. 16. System Tools

4. 16. 1. Time Settings

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Time Settings and configure the system time as needed.

- To set time manually:
- 1. Select your local time zone.
- 2. Enter the Date in Month/Day/Year format.
- 3. Enter the Time in Hour/Minute/Second format.
- 4. Click Save.
- To set time automatically:
- 1. Select your local time zone.
- 2. Enter the address or domain of the NTP Server I or NTP Server II.

- 3. Click Get GMT to get time from the internet if you have connected to the internet.
- To set Daylight Saving Time:
- 1. Select Enable Daylight Saving.
- 2. Select the start time from the drop-down list in the Start field.
- 3. Select the end time from the drop-down list in the End field.
- 4. Click Save.

Note: This setting will be used for some time-based functions such as firewall. You must specify your time zone once you log in to the router successfully; otherwise, time-based functions will not take effect.

4. 16. 2. Diagnostic

Diagnostic is used to test the connectivity between the router and the host or other network devices.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Diagnostic.

- Diagnostic Tool Select one diagnostic tool.
 - Ping This diagnostic tool troubleshoots connectivity, reachability, and name resolution to a given host or gateway.
 - Tracerouter This diagnostic tool tests the performance of a connection.
- Note: You can use ping/traceroute to test both numeric IP address or domain name. If pinging/tracerouting the IP address is successful, but pinging/tracerouting the domain name is not, you might have a name resolution problem. In this case, ensure that the domain name you are specifying can be resolved by using Domain Name System (DNS) queries.
- IP address/Domain name Enter the destination IP address (such as 192.168.0.1) or Domain name (such as www.tp-link.com).
- Pings Count The number of Ping packets for a Ping connection.
- Ping Packet Size The size of Ping packet.
- Ping Timeout Set the waiting time for the reply of each Ping packet. If there is no reply in the specified time, the connection is overtime.

- Traceroute Max TTL The max number of hops for a Traceroute connection.
- 3. Click Start to check the connectivity of the internet.
- 4. The Diagnostic Results page displays the diagnosis result. If the result is similar to the following figure, the connectivity of the internet is fine.

```
Diagnostic Results
Pinging 192.168.0.1 with 64 bytes of data:
Reply from 192.168.0.1: bytes=64 time=1
                                            TTL=64
Reply from 192.168.0.1: bytes=64 time=1
                                            TTL=64
                                                    seq=2
Reply from 192.168.0.1: bytes=64 time=1
                                            TTL=64
                                                    seq=3
Reply from 192.168.0.1: bytes=64 time=1
                                            TTL=64
                                                    seq=4
Ping statistics for 192.168.0.1
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss)
Approximate round trip times in milliseconds:
Minimum = 1, Maximum = 1, Average = 1
```

Note: Only one user can use this tool at one time. Options "Number of Pings", "Ping Size" and "Ping Timeout" are used for the Ping function. Option "Tracert Hops" is used for the Tracert function.

4. 16. 3. Firmware Upgrade

TP-Link is dedicated to improving and richening the product features, giving users a better network experience. We will release the latest firmware at TP-Link official website. You can download the latest firmware file from the Support page of our website www.tp-link.com and upgrade the firmware to the latest version.

- 1. Download the latest firmware file for the router from our website www.tp-link.com.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to System Tools > Firmware Upgrade.
- 4. Click Choose File to locate the downloaded firmware file, and click Upgrade.

4. 16. 4. Factory Defaults

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- Go to System Tools > Factory Defaults. Click Restore to reset all settings to the default values.

The default Username: admin

The default Password: admin

The default IP Address: 192.168.0.1

The default Subnet Mask: 255.255.255.0

4. 16. 5. Backup & Restore

The configuration settings are stored as a configuration file in the router. You can backup the configuration file in your computer for future use and restore the router to the previous settings from the backup file when needed.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Backup & Restore.

To backup configuration settings:

Click Backup to save a copy of the current settings in your local computer. A ".bin" file of the current settings will be stored in your computer.

- To restore configuration settings:
- 1. Click Choose File to locate the backup configuration file stored in your computer, and click Restore.
- 2. Wait a few minutes for the restoring and rebooting.

Note: During the restoring process, do not power off or reset the router.

4. 16. 6. Reboot

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Reboot, and you can restart your router.

Some settings of the router will take effect only after rebooting, including:

- Change the LAN IP Address (system will reboot automatically).
- Change the DHCP Settings.
- · Change the Web Management Port.
- Upgrade the firmware of the router (system will reboot automatically).
- Restore the router to its factory defaults (system will reboot automatically).
- Update the configuration with the file (system will reboot automatically).

4. 16. 7. Password

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Password, and you can change the factory default username and password of the router.

It is strongly recommended that you change the default username and password of the router, for all users that try to access the router's web-based utility or Quick Setup will be prompted for the router's username and password.

Note: The new username and password must not exceed 15 characters and not include any spacing.

3. Click Save.

4. 16. 8. System Log

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > System Log, and you can view the logs of the router.

- Refresh Refresh the page to show the latest log list.
- Clear Log All the logs will be deleted from the router permanently, not just from the page.
- Save Log Click to save all the logs in a txt file.
- Log Settings Click to set the logs in the screen.
 - Save Locally If Save Locally is selected, events will be recorded in the local memory.
 - Minimum Level Select the Minimum level in the drop-down list, for the Minimum Level, all logged events above or equal to the selected level will be displayed.
 - Save Remotely If Save Remotely is selected, events will be sent to the specified IP address and UDP port of the remote system log server.

4. 16. 9. Statistics

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router
- 2. Go to System Tools > Statistics, and you can view the statistics of the router, including total traffic and the value of the last Packet Statistic Interval in seconds.

- Traffic Statistics Enable or Disable. The default value is disabled. To enable, click the Enable button. If disabled, the function of DoS protection in Security settings will disabled.
- Statistics Interval The default value is 10. Select a value between 5 and 60 in the drop-down list. The Packets Statistic Interval indicates the time section of the packets statistic.
- · Click Refresh to refresh immediately.
- Click Reset All to reset the values of all the entries to zero.
- Click Delete All to delete all entries in the table.

Statistics Table

| IP/MAC Address The IP and MAC address are displayed with related statistics. | | The IP and MAC address are displayed with related statistics. |
|--|--|--|
| Packets | The total number of packets received and transmitted by the router. | |
| Total Bytes | | The total number of bytes received and transmitted by the router. |
| Packets | Doolsoto | The total number of packets received and transmitted in the last Packets Statistic interval |
| | seconds. | |
| | Bytes | The total number of bytes received and transmitted in the last Packets Statistic interval seconds. |
| Current ICMP Tx | The number of the ICMP packets transmitted to WAN per second at the specified Packets | |
| | Statistics interval. It is shown like "current transmitting rate / Max transmitting rate". | |
| | UDP Tx | The number of UDP packets transmitted to the WAN per second at the specified Packets |
| ODP IX | Statistics interval. It is shown like "current transmitting rate / Max transmitting rate". | |
| TCP SYN Tx | The number of TCP SYN packets transmitted to the WAN per second at the specified Packets | |
| | Statistics interval. It is shown like "current transmitting rate / Max transmitting rate". | |
| Operation | Reset | Reset the value of the entry to zero. |
| | Delete | Delete the existing entry in the table. |

4. 17. Log Out

Click Logout at the bottom of the main menu, and you will log out of the web management page and return to the login window.

Chapter 5

Configure the Router in Access Point Mode

This chapter presents how to configure the various features of the router working as an access point.

It contains the following sections:

- Status
- Operation Mode
- Network
- Wireless
- DHCP
- USB Settings
- System Tools
- Log Out

5. 1. Status

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- Go to Status. You can view the current status information of the router in Access Point Mode.

- Firmware Version The version information of the router's firmware.
- Hardware Version The version information of the router's hardware.
- LAN- This field displays the current settings of the LAN, and you can configure them on the Network > LAN page.
 - MAC Address The physical address of the router.
 - IP Address The LAN IP address of the router.
 - Subnet Mask The subnet mask associated with the LAN IP address.

- Wireless 2.4GHz/5GHz This field displays the basic information or status of the wireless function, and you can configure them on the Wireless 2.4GHz/5GHz > Basic Settings page.
 - Operation Mode The current operation mode of the router.
 - Wireless Radio Indicates whether the wireless feature is enabled or not
 - Name (SSID) The SSID of the network.
 - Mode The current wireless working mode in use.
 - Channel The current wireless channel in use.
 - Channel Width The current wireless channel width in use.
 - MAC Address The physical address of the router.
- System Up Time The length of the time since the router was last powered on or reset.

Click Refresh to get the latest status and settings of the router.

5. 2. Operation Mode

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Operation Mode.
- 3. Select the operation mode as needed and click Save.

5.3. Network

5. 3. 1. LAN

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Network > LAN.
- 3. Configure the IP parameters of the LAN and click Save.

- LAN Type Either select Smart IP(DHCP) to get IP address from DHCP server, or Static
 IP to configure IP address manually.
- MAC Address The physical address of the LAN port. The value can not be changed.
- IP Address Enter the IP address in dotted-decimal notation if your select Static IP (factory default - 192.168.0.254).
- Subnet Mask An address code that determines the size of the network. Normally 255,255,255.0 is used as the subnet mask.

Note

- If you have changed the IP address, you must use the new IP address to login.
- If you select Smart IP(DHCP), the DHCP server of the router will not start up.
- If the new IP address you set is not in the same subnet as the old one, the IP Address pool in the DHCP Server will be configured automatically, but the Virtual Server and DMZ Host will not take effect until they are re-configured.

5. 4. Wireless

5. 4. 1. Basic Settings

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Basic Settings.
- 3. Configure the basic settings for the 2.4GHz/5GHz wireless network and click Save.

- Wireless Network Name Enter a string of up to 32 characters. The default SSID is TP-Link_XXXX (XXXX indicates the last unique four numbers of each router's MAC address). It is strongly recommended that you change your network name (SSID). This value is case-sensitive. For example, TEST is NOT the same as test.
- Mode Select the desired mode. It is strongly recommended that you keep the default setting 11bgn mixed or 11a/n/ac mixed.
- Channel Width Select any channel width from the drop-down list. The default setting is Auto, which can automatically adjust the channel width for your clients.
- Channel This field determines which operating frequency will be used. The default channel is set to Auto. It is not necessary to change the wireless channel unless you notice interference problems with another nearby access point.
- Enable SSID Broadcast If enabled, the router will broadcast the wireless network name (SSID).

5, 4, 2, WPS

WPS (Wi-Fi Protected Setup) can help you to quickly and securely connect to a network. This section will guide you to add a new wireless device to your router's network quickly via WPS.

Note: The WPS function cannot be configured if the wireless function of the router is disabled. Please make sure the wireless function is enabled before configuration.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > WPS.
- 3. Follow one of the following three methods to connect your client device to the router's Wi-Fi network.

Method ONE: Press the WPS Button on Your Client Device

1. Keep the WPS Status as Enabled and click Add Device.

Select Press the WPS button of the new device within the next two minutes and click Connect.

- 3. Within two minutes, press the WPS button on your client device.
- 4. A success message will appear on the WPS page if the client device has been successfully added to the router's network.

Method TWO: Enter the Client's PIN

1. Keep the WPS Status as Enabled and click Add Device.

2. Select Enter the new device's PIN, enter your client device's current PIN in the PIN filed and click Connect.

3. A success message will appear on the WPS page if the client device has been successfully added to the router's network.

Method Three: Enter the Router's PIN

1. Keep the WPS Status as Enabled and get the Current PIN of the router.

2. Enter the router's current PIN on your client device to join the router's Wi-Fi network.

5. 4. 3. Wireless Security

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Wireless Security.
- 3. Configure the security settings of your 2.4GHz/5GHz wireless network and click Save.

- Disable Wireless Security The wireless security function can be enabled or disabled. If disabled, wireless clients can connect to the router without a password. It's strongly recommended to choose one of the following modes to enable security.
- WPA/WPA2-Personal It's the WPA/WPA2 authentication type based on pre-shared passphrase.
 - Version Select Auto, WPA-PSK or WPA2-PSK.
 - Encryption Select Auto, TKIP or AES.
 - Wireless Password Enter ASCII or Hexadecimal characters. For Hexadecimal, the length should be between 8 and 64 characters; for ASCII, the length should be between 8 and 63 characters.
 - Group Key Update Period Specify the group key update interval in seconds. The value can be 0 or at least 30. Enter 0 to disable the update.
- WPA/WPA2-Enterprise It's based on Radius Server.

- Version Select Auto, WPA or WPA2.
- Encryption Select Auto, TKIP or AES.
- Radius Server IP Enter the IP address of the Radius server.
- Radius Port Enter the port that Radius server used.
- Radius Password Enter the password for the Radius server.
- Group Key Update Period Specify the group key update interval in seconds. The value should be 30 or above. Enter 0 to disable the update.
- WEP It is based on the IEEE 802.11 standard.
 - Type The default setting is Auto, which can select Shared Key or Open System authentication type automatically based on the wireless client's capability and request.
 - WEP Key Format Hexadecimal and ASCII formats are provided here.
 Hexadecimal format stands for any combination of hexadecimal digits (0-9, a-f, A-F) in the specified length. ASCII format stands for any combination of keyboard characters in the specified length.
 - WEP Key (Password) Select which of the four keys will be used and enter the matching WEP key. Make sure these values are identical on all wireless clients in your network.
 - Key Type Select the WEP key length (64-bit, 128-bit or 152-bit) for encryption.
 Disabled means this WEP key entry is invalid.
 - 64-bit Enter 10 hexadecimal digits (any combination of 0-9, a-f and A-F. Null key is not permitted) or 5 ASCII characters.
 - 128-bit Enter 26 hexadecimal digits (any combination of 0-9, a-f and A-F. Null key is not permitted) or 13 ASCII characters.
 - 152-bit Enter 32 hexadecimal digits (any combination of 0-9, a-f and A-F. Null key is not permitted) or 16 ASCII characters.

5. 4. 4. Wireless MAC Filtering

Wireless MAC Filtering is used to deny or allow specific wireless client devices to access your network by their MAC addresses.

I want to:

Deny or allow specific wireless client devices to access my network by their MAC addresses.

For example, you want the wireless client A with the MAC address 00:0A:EB:B0:00:0B and the wireless client B with the MAC address 00:0A:EB:00:07:5F to access the router, but other wireless clients cannot access the router.

How can I do that?

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Wireless MAC Filtering.
- 3. Click Enable to enable the Wireless MAC Filtering function.
- **4.** Select Allow the stations specified by any enabled entries in the list to access as the filtering rule.
- 5. Delete all or disable all entries if there are any entries already.
- 6. Click Add New and fill in the blank.

- 1) Enter the MAC address 00:0A:EB:B0:00:0B/00:0A:EB:00:07:5F in the MAC Address field.
- 2) Enter wireless client A/B in the Description field.
- 3) Select Enabled in the Status drop-down list.
- 4) Click Save and click Back.
- 7. The configured filtering rules should be listed as the picture shows below.

Done! Now only client A and client B can access your network.

5. 4. 5. Wireless Advanced

1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.

2. Go to Wireless 2.4GHz/5GHz > Wireless Advanced.

3. Configure the advanced settings of your wireless network and click Save.

Note: If you are not familiar with the setting items on this page, it's strongly recommended to keep the provided default values; otherwise it may result in lower wireless network performance.

- Transmit Power Select High, Middle or Low which you would like to specify for the router. High is the default setting and recommended.
- Beacon Interval Enter a value between 40-1000 milliseconds for Beacon Interval here. Beacon Interval value determines the time interval of the beacons. The beacons are the packets sent by the router to synchronize a wireless network. The default value is 100.
- RTS Threshold Here you can specify the RTS (Request to Send) Threshold. If the
 packet is larger than the specified RTS Threshold size, the router will send RTS frames
 to a particular receiving station and negotiate the sending of a data frame. The default
 value is 2346.
- Fragmentation Threshold This value is the maximum size determining whether packets will be fragmented. Setting a low value for the Fragmentation Threshold may result in poor network performance because of excessive packets. 2346 is the default setting and is recommended.
- DTIM Interval This value determines the interval of the Delivery Traffic Indication Message (DTIM). A DTIM field is a countdown field informing clients of the next window for listening to broadcast and multicast messages. When the router has buffered broadcast or multicast messages for associated clients, it sends the next DTIM with a DTIM Interval value. You can specify the value between 1-255 Beacon Intervals. The default value is 1, which indicates the DTIM Interval is the same as Beacon Interval.
- Enable Short GI It is recommended to enable this function, for it will increase the data capacity by reducing the guard interval time.
- Enable Client Isolation This function isolates all connected wireless stations so that wireless stations cannot access each other through WLAN. This function will be disabled if WDS/Bridge is enabled.

• Enable WMM - WMM function can guarantee the packets with high-priority messages being transmitted preferentially. It is strongly recommended to enable this function.

5. 4. 6. Wireless Statistics

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Wireless Statistics to check the data packets sent and received by each client device connected to the router.

- MAC Address The MAC address of the connected wireless client.
- Current Status The running status of the connected wireless client.
- Received Packets Packets received by the wireless client.
- Sent Packets Packets sent by the wireless client.
- SSID SSID that the wireless client is connected to.

5. 4. 7. Throughput Monitor

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Throughput Monitor to view the wireless throughput information.

- Rate The Throughput unit.
- Run Time How long this function is running.
- Transmit Wireless transmit rate information.
- Receive Wireless receive rate information.

Click Start/Stop to start or stop wireless throughput monitor.

5. 5. DHCP

By default, the DHCP (Dynamic Host Configuration Protocol) Server is enabled and the router acts as a DHCP server; it dynamically assigns TCP/IP parameters to client devices from the IP Address Pool. You can change the settings of DHCP Server if necessary, and you can reserve LAN IP addresses for specified client devices.

5. 5. 1. DHCP Settings

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to DHCP > DHCP Settings.
- 3. Specify DHCP server settings and click Save.

- DHCP Server Enable or disable the DHCP server. If disabled, you must have another DHCP server within your network or else you must configure the computer manually.
- Start IP Address Specify an IP address for the DHCP Server to start with when assigning IP addresses. 192.168.0.100 is the default start address.
- End IP Address Specify an IP address for the DHCP Server to end with when assigning IP addresses. 192.168.0.199 is the default end address.
- Address Lease Time The Address Lease Time is the amount of time a network user will be allowed to connect to the router with the current dynamic IP Address. When time is up, the user will be automatically assigned a new dynamic IP address. The range of the time is 1 ~ 2880 minutes. The default value is 120.
- Default Gateway (Optional) It is suggested to input the IP address of the LAN port of the router. The default value is 192.168.0.254.
- Default Domain (Optional) Input the domain name of your network.
- Primary DNS (Optional) Input the DNS IP address provided by your ISP.
- Secondary DNS (Optional) Input the IP address of another DNS server if your ISP provides two DNS servers.
- Note: To use the DHCP server function of the router, you must configure all computers on the LAN as Obtain an IP Address automatically.

5. 5. 2. DHCP Client List

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to DHCP > DHCP Client List to view the information of the clients connected to the router.

- Client Name The name of the DHCP client.
- MAC Address The MAC address of the DHCP client.
- Assigned IP The IP address that the outer has allocated to the DHCP client.
- Lease Time The time of the DHCP client leased. After the dynamic IP address has expired, a new dynamic IP address will be automatically assigned to the user.

You cannot change any of the values on this page. To update this page and show the current attached devices, click Refresh.

5. 5. 3. Address Reservation

You can reserve an IP address for a specific client. When you specify a reserved IP address for a PC on the LAN, this PC will always receive the same IP address each time when it accesses the DHCP server.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to DHCP > Address Reservation.
- 3. Click Add New and fill in the blank.

- 1) Enter the MAC address (in XX:XX:XX:XX:XX format) of the client for which you want to reserve an IP address.
- 2) Enter the IP address (in dotted-decimal notation) which you want to reserve for the client.
- 3) Leave the Status as Enabled.
- 4) Click Save.

5. 6. USB Settings

You can insert a USB drive to share files among users on the LAN, access the USB drive remotely on the internet and enjoy videos and photos stored in the USB drive.

5. 6. 1. Storage Sharing

Share your USB storage device with different users on the network.

To access the USB disk:

1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips:

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage: Go to USB Settings > USB Mass Storage and click Disconnect.

2. Access Your USB Disk

By default, all the network clients can access your USB disk. Refer to the following table for access instructions. You can customize user accounts by referring to <u>User Accounts</u>.

- To customize your settings:
- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > Storage Sharing.

- Server Status the Storage Sharing's current status.
- Anonymous access to all volumes This function is enabled by default, so users can access all activated volumes of Storage Sharing without accounts. If you want to add

a shared folder which does not allow anonymous login, uncheck the box to disable this function. And Folder Table will be displayed as shown below.

- Share Name This folder's display name.
- Directory The real full path of the specified folder.
- User Access The authorization of the user is displayed. * users mean Super Users
 who have the full-access permission to all activated volumes and share folders. Grey
 users mean the users who have no right to use this function. Others are common
 users.
- Status The status of the entry is enabled or disabled.
- Edit Click Edit in the table, and then you can modify the entry.

5. 6. 2. FTP Server

You can share specific folders on you USB drive on the LAN or access your USB drive outside the local area network.

For example:

- Only share specific folders with clients on the LAN.
- Share photos and other large files with your friends without logging in to (and paying for) a photo-sharing site or email system.
- Get a safe backup for the material for a presentation.
- To set up your FTP server:

```
FIP Server Settings

Server States. Lincolded [ Hardward ]

I de not Access. © Disable () Disable

I de not Access. © 0.000

Single Park [ 21 | (150 constant 25 Lie not monthly interes reconstant))
```

- 1. Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to USB Settings > FTP Server.
- 4. Click Enable to enable the FTP Server.
- 5. Click Enable to enable the internet access to the FTP server.
- 6. Specify a port number for the Service Port. The default value is 21.
- 7. Click Apply.
- To specify a folder to be accessed via the FTP server:

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > FTP Server.
- 3. Click Add New Folder.
- 4. Specify a name for the folder to be shared in the Share Name field. And select the folder you want to share. And determine the access right of user accounts.

- 5. Click Apply.
- 6. You can check which folder is shared and also edit or delete the folder.

- To access the USB disk locally:
- 1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips:

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage:
 Go to USB Settings > USB Mass Storage and click Disconnect.
- 2. Access Your USB Disk Locally

Refer to the following table for access instructions. You can customize user accounts by referring to User Accounts.

To access the USB disk remotely:

Refer to the following table for access instructions. You can customize user accounts by referring to <u>User Accounts</u>.

5. 6. 3. Media Server

The Media Server feature allows to view photos, play music and watch movies on the USB drive directly with DLNA-supported devices, such as on your computer, pad and PS2/3/4.

- To share specific folders:
- 1. Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to USB Settings > Media Server.
- 4. Click Enable to enable the Media Server.

5. Click Add New Folder. Specify a name for the folder to be shared in the Share Name field. And select the folder you want to share.

6. Click Apply.

- To access the USB disk:
- 1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips:

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage: Go to USB Settings > USB Mass Storage and click Disconnect.
- 2. Access the Media Files on Your USB Disk

Now the DLNA-supported devices (such as your computer and pad) connected to the router can detect and play the media files on the USB disk.

5. 6. 4. User Accounts

You can specify the username and password for Storage Sharing and FTP Server access.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > User Accounts.
- 3. Choose the Index for the account and specify a new username and password in the New Username and New Password fields, and reenter the password for confirmation.
- Note: For an account with Index 1, it is the Super User with full access to all active volumes and shared folders.

4. Click Set.

5. You can check the newly added account and also edit or delete the account.

5. 7. System Tools

5.7.1. Diagnostic

Diagnostic is used to test the connectivity between the router and the host or other network devices.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Diagnostic.

- Diagnostic Tool Select one diagnostic tool.
 - Ping This diagnostic tool troubleshoots connectivity, reachability, and name resolution to a given host or gateway.
 - Tracerouter This diagnostic tool tests the performance of a connection.

Note: You can use ping/traceroute to test both numeric IP address or domain name. If pinging/tracerouting the IP address is successful, but pinging/tracerouting the domain name is not, you might have a name resolution problem. In this case, ensure that the domain name you are specifying can be resolved by using Domain Name System (DNS) queries.

- IP Address/Domain Name Enter the destination IP address (such as 192.168.0.1) or Domain name (such as www.tp-link.com).
- Pings Count The number of Ping packets for a Ping connection.
- Ping Packet Size The size of Ping packet.
- Ping Timeout Set the waiting time for the reply of each Ping packet. If there is no reply in the specified time, the connection is overtime.
- Traceroute Max TTL The max number of hops for a Traceroute connection.
- 3. Click Start to check the connectivity of the internet.
- 4. The Diagnostic Results page displays the diagnosis result. If the result is similar to the following figure, the connectivity of the internet is fine.

```
Diagnostic Results

Pinging 192.168.0.1 with 64 bytes of data:

Reply from 192.168.0.1: bytes=64 time=1 TTL=64 seq=1
Reply from 192.168.0.1: bytes=64 time=1 TTL=64 seq=2
Reply from 192.168.0.1: bytes=64 time=1 TTL=64 seq=3
Reply from 192.168.0.1: bytes=64 time=1 TTL=64 seq=4

Ping statistics for 192.168.0.1
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss)
Approximate round trip times in milliseconds:
Minimum = 1, Maximum = 1, Average = 1
```

Note: Only one user can use this tool at one time. Options "Number of Pings", "Ping Size" and "Ping Timeout" are used for the Ping function. Option "Tracert Hops" is used for the Tracert function.

5. 7. 2. Ping Watch Dog

The Ping Watch Dog is dedicated for continuous monitoring of the particular connection to remote host using the Ping tool. It makes the router continuously ping a user defined IP address (it can be the internet gateway for example). If it is unable to ping under the user defined constraints, the router will automatically reboot.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Ping Watch Dog. Configure the settings and click Save.

- Switch- Enable or disable Ping Watch Dog.
- Destination IP The IP address of the target host where the Ping Watch Dog Utility is sending ping packets.
- Interval Time interval between two ping packets which are sent out continuously.
- Startup Delay Time delay before first ping packet is sent out when the router is restarted.
- Fail Count Upper limit of the ping packets the router can drop continuously. If this value is overrun, the router will restart automatically.

5. 7. 3. Firmware Upgrade

TP-Link is dedicated to improving and richening the product features, giving users a better network experience. We will release the latest firmware at TP-Link official website. You can download the latest firmware file from the Support page of our website www.tp-link.com and upgrade the firmware to the latest version.

- 1. Download the latest firmware file for the router from our website www.tp-link.com.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to System Tools > Firmware Upgrade.
- 4. Click Choose File to locate the downloaded firmware file, and click Upgrade.

5. 7. 4. Factory Defaults

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- Go to System Tools > Factory Defaults. Click Restore to reset all settings to the default values.

• The default Username: admin

• The default Password: admin

The default IP Address: 192.168.0.254

The default Subnet Mask: 255.255.255.0

5.7.5. Backup & Restore

The configuration settings are stored as a configuration file in the router. You can backup the configuration file in your computer for future use and restore the router to the previous settings from the backup file when needed.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Backup & Restore.

To backup configuration settings:

Click Backup to save a copy of the current settings in your local computer. A ".bin" file of the current settings will be stored in your computer.

- To restore configuration settings:
- 1. Click Choose File to locate the backup configuration file stored in your computer, and click Restore.
- 2. Wait a few minutes for the restoring and rebooting.
- Note: During the restoring process, do not power off or reset the router.

5. 7. 6. Reboot

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Reboot, and you can restart your router.

Some settings of the router will take effect only after rebooting, including:

- Change the LAN IP Address (system will reboot automatically).
- Change the DHCP settings.
- Change the operation mode.
- Change the web management port.
- Upgrade the firmware of the router (system will reboot automatically).
- Restore the router to its factory defaults (system will reboot automatically).
- Update the configuration with the file (system will reboot automatically).

5. 7. 7. Password

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Password, and you can change the factory default username and password of the router.

It is strongly recommended that you change the default username and password of the router, for all users that try to access the router's web-based utility or Quick Setup will be prompted for the router's username and password.

Note: The new username and password must not exceed 15 characters and not include any spacing.

3. Click Save.

5. 7. 8. **System Log**

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > System Log, and you can view the logs of the router.

- Refresh Refresh the page to show the latest log list.
- Clear Log All the logs will be deleted from the router permanently, not just from the page.
- Save Log Click to save all the logs in a txt file.
- Log Settings Click to set the logs in the screen.
 - Save Locally If Save Locally is selected, events will be recorded in the local memory.
 - Minimum Level Select the Minimum level in the drop-down list, for the Minimum Level, all logged events above or equal to the selected level will be displayed.
 - Save Remotely If Save Remotely is selected, events will be sent to the specified IP address and UDP port of the remote system log server.

5.8. Log Out

Click Logout at the bottom of the main menu, and you will log out of the web page and return to the login window.

Chapter 6

Configure the Router in Range Extender Mode

This chapter presents how to configure the various features of the router working as a range extender.

It contains the following sections:

- Status
- Operation Mode
- Network
- Wireless
- DHCP
- USB Settings
- System Tools
- Log Out

6. 1. Status

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Status. You can view the current status information of the router in Range Extender Mode.

- Firmware Version The version information of the router's firmware.
- Hardware Version The version information of the router's hardware.
- LAN This field displays the current settings of the LAN, and you can configure them on the Network > LAN page.
 - MAC Address The physical address of the router.
 - IP Address The LAN IP address of the router.
 - Subnet Mask The subnet mask associated with the LAN IP address.

- Wireless 2.4GHz/5GHz This field displays the basic information or status of the wireless function, and you can configure them on the Wireless 2.4GHz/5GHz > Basic Settings page.
 - Operation Mode The current operation mode of the router.
 - Wireless Radio Indicates whether the wireless feature is enabled or not.
 - Name (SSID) of Root AP The SSID of the connected host network.
 - Name (SSID) The SSID of the network.
 - Mode The current wireless working mode in use.
 - Channel Width The current wireless channel width in use.
 - Channel The current wireless channel in use.
 - MAC Address The physical address of the router.
- System Up Time The length of the time since the router was last powered on or reset.

Click Refresh to get the latest status and settings of the router.

6. 2. Operation Mode

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Operation Mode.
- 3. Select the operation mode as needed and click Save.

6.3. Network

6. 3. 1. LAN

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Network > LAN.
- 3. Configure the IP parameters of the LAN and click Save.

- LAN Type Either select Smart IP(DHCP) to get IP address from DHCP server, or Static IP to configure IP address manually.
- MAC Address The physical address of the LAN port. The value can not be changed.
- IP Address Enter the IP address in dotted-decimal notation if your select Static IP (factory default 192.168.0.254).
- Subnet Mask An address code that determines the size of the network. Normally 255,255,255.0 is used as the subnet mask.

Note:

- If you have changed the IP address, you must use the new IP address to login.
- If you select Smart IP(DHCP), the DHCP server of the router will not start up.
- If the new IP address you set is not in the same subnet as the old one, the IP Address pool in the DHCP Server will be configured automatically, but the Virtual Server and DMZ Host will not take effect until they are re-configured.

6. 4. Wireless

6. 4. 1. Connect to Network

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Connect to Network.
- 3. Configure the settings for the host network you want to connect to and click Save.

Scan - Click to scan for wireless networks. When a host network is selected, the SSID,
 MAC Address and Security type will be automatically filled in.

 Password - Enter the password of the host network you want to connect to if it is encrypted.

6. 4. 2. Extended Network

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Extended Network.
- 3. Configure the settings of the 2.4GHz/5GHz extended network and click Save.

- Extended 2.4GHz/5GHz SSID Either use the Copy Host SSID button to copy the SSID of the host network or enter a new one (up to 32 characters). This field is casesensitive.
- Extended 2.4GHz/5GHz Security Select one of the security options for the extended wireless network.

6. 4. 3. Wireless MAC Filtering

Wireless MAC Filtering is used to deny or allow specific wireless client devices to access your network by their MAC addresses.

I want to:

Deny or allow specific wireless client devices to access my network by their MAC addresses.

For example, you want the wireless client A with the MAC address 00:0A:EB:B0:00:0B and the wireless client B with the MAC address 00:0A:EB:00:07:5F to access the router, but other wireless clients cannot access the router.

How can I do that?

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Wireless MAC Filtering.
- 3. Click Enable to enable the Wireless MAC Filtering function.

- **4.** Select Allow the stations specified by any enabled entries in the list to access as the filtering rule.
- 5. Delete all or disable all entries if there are any entries already.
- 6. Click Add New and fill in the blank.

- 1) Enter the MAC address 00:0A:EB:B0:00:0B/00:0A:EB:00:07:5F in the MAC Address field.
- 2) Enter wireless client A/B in the Description field.
- 3) Leave the status as Enabled.
- 4) Click Save and click Back.
- 7. The configured filtering rules should be listed as the picture shows below.

Done! Now only client A and client B can access your network.

6. 4. 4. Wireless Advanced

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Wireless Advanced.
- 3. Configure the advanced settings of your wireless network and click Save.
- Note: If you are not familiar with the setting items on this page, it's strongly recommended to keep the provided default values; otherwise it may result in lower wireless network performance.

- Transmit Power Select High, Middle or Low which you would like to specify for the router. High is the default setting and recommended.
- Beacon Interval Enter a value between 40-1000 milliseconds for Beacon Interval here. Beacon Interval value determines the time interval of the beacons. The beacons are the packets sent by the router to synchronize a wireless network. The default value is 100.
- RTS Threshold Here you can specify the RTS (Request to Send) Threshold. If the
 packet is larger than the specified RTS Threshold size, the router will send RTS frames
 to a particular receiving station and negotiate the sending of a data frame. The default
 value is 2346.
- Fragmentation Threshold This value is the maximum size determining whether
 packets will be fragmented. Setting a low value for the Fragmentation Threshold may
 result in poor network performance because of excessive packets. 2346 is the default
 setting and is recommended.
- DTIM Interval This value determines the interval of the Delivery Traffic Indication Message (DTIM). A DTIM field is a countdown field informing clients of the next window for listening to broadcast and multicast messages. When the router has buffered broadcast or multicast messages for associated clients, it sends the next DTIM with a DTIM Interval value. You can specify the value between 1-255 Beacon Intervals. The default value is 1, which indicates the DTIM Interval is the same as Beacon Interval.
- Enable Short GI It is recommended to enable this function, for it will increase the data capacity by reducing the guard interval time.
- Enable Client Isolation This function isolates all connected wireless stations so that wireless stations cannot access each other through WLAN. This function will be disabled if WDS/Bridge is enabled.

• Enable WMM - WMM function can guarantee the packets with high-priority messages being transmitted preferentially. It is strongly recommended to enable this function.

6. 4. 5. Wireless Statistics

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5Ghz > Wireless Statistics to check the data packets sent and received by each client device connected to the router.

- MAC Address The MAC address of the connected wireless client.
- Current Status The running status of the connected wireless client.
- Received Packets Packets received by the wireless client.
- Sent Packets Packets sent by the wireless client.
- SSID SSID that the wireless client is connected to.

6. 5. DHCP

By default, the DHCP (Dynamic Host Configuration Protocol) Server is enabled and the router acts as a DHCP server; it dynamically assigns TCP/IP parameters to client devices from the IP Address Pool. You can change the settings of DHCP Server if necessary, and you can reserve LAN IP addresses for specified client devices.

6. 5. 1. DHCP Settings

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to DHCP > DHCP Settings.
- 3. Specify DHCP server settings and click Save.

- DHCP Server Enable or disable the DHCP server. If disabled, you must have another DHCP server within your network or else you must configure the computer manually.
- Start IP Address Specify an IP address for the DHCP Server to start with when assigning IP addresses. 192.168.0.100 is the default start address.
- End IP Address Specify an IP address for the DHCP Server to end with when assigning IP addresses. 192.168.0.199 is the default end address.
- Address Lease Time The Address Lease Time is the amount of time a network user will be allowed to connect to the router with the current dynamic IP Address. When time is up, the user will be automatically assigned a new dynamic IP address. The range of the time is 1 ~ 2880 minutes. The default value is 120.
- Default Gateway (Optional) It is suggested to input the IP address of the LAN port of the router. The default value is 192.168.0.254.
- Default Domain (Optional) Input the domain name of your network.
- Primary DNS (Optional) Input the DNS IP address provided by your ISP.
- Secondary DNS (Optional) Input the IP address of another DNS server if your ISP provides two DNS servers.
- Note: To use the DHCP server function of the router, you must configure all computers on the LAN as Obtain an IP Address automatically.

6. 5. 2. DHCP Client List

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to DHCP > DHCP Client List to view the information of the clients connected to the router.

- Client Name The name of the DHCP client.
- MAC Address The MAC address of the DHCP client.
- Assigned IP The IP address that the router has allocated to the DHCP client.
- Lease Time The time of the DHCP client leased. After the dynamic IP address has expired, a new dynamic IP address will be automatically assigned to the user.

You cannot change any of the values on this page. To update this page and show the current attached devices, click Refresh.

6. 6. USB Settings

You can insert a USB drive to share files among users on the LAN, access the USB drive remotely on the internet and enjoy videos and photos stored in the USB drive.

6. 6. 1. Storage Sharing

Share your USB storage device with different users on the network.

- To access the USB disk:
- 1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips:

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage: Go to USB Settings > USB Mass Storage and click Disconnect.

2. Access Your USB Disk

By default, all the network clients can access your USB disk. Refer to the following table for access instructions. You can customize user accounts by referring to <u>User Accounts</u>.

To customize your settings:

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > Storage Sharing.

- Server Status the Storage Sharing's current status.
- Anonymous access to all volumes This function is enabled by default, so users can
 access all activated volumes of Storage Sharing without accounts. If you want to add
 a shared folder which does not allow anonymous login, uncheck the box to disable
 this function. And Folder Table will be displayed as shown below.
- Share Name This folder's display name.
- Directory The real full path of the specified folder.
- User Access The authorization of the user is displayed. * users mean Super Users
 who have the full-access permission to all activated volumes and share folders. Grey
 users mean the users who have no right to use this function. Others are common
 users.
- Status The status of the entry is enabled or disabled.
- Edit Click Edit in the table, and then you can modify the entry.

6. 6. 2. FTP Server

You can share specific folders on you USB drive on the LAN or access your USB drive outside the local area network.

For example:

- Only share specific folders with clients on the LAN.
- Share photos and other large files with your friends without logging in to (and paying for) a photo-sharing site or email system.
- Get a safe backup for the material for a presentation.
- To set up your FTP server:

```
FIF Server Settings

Server State. Leader: | Harbor |
I find not Access. | © Dade () Double
Intend Address. | 00,00

Note: Part | 21 | (1 to occupant of the not compositions recovery)
```

- 1. Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to USB Settings > FTP Server.
- 4. Click Enable to enable the FTP Server.
- 5. Click Enable to enable the internet access to the FTP server.
- 6. Specify a port number for the Service Port. The default value is 21.
- 7. Click Apply.
- To specify a folder to be accessed via the FTP server:
- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > FTP Server.
- 3. Click Add New Folder.
- 4. Specify a name for the folder to be shared in the Share Name field. And select the folder you want to share. And determine the access right of user accounts.

- 5. Click Apply.
- 6. You can check which folder is shared and also edit or delete the folder.

- To access the USB disk locally:
- 1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips:

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage:
 Go to USB Settings > USB Mass Storage and click Disconnect.

2. Access Your USB Disk Locally

Refer to the following table for access instructions. You can customize user accounts by referring to <u>User Accounts</u>.

To access the USB disk remotely:

Refer to the following table for access instructions. You can customize user accounts by referring to <u>User Accounts</u>.

6. 6. 3. Media Server

The Media Server feature allows to view photos, play music and watch movies on the USB drive directly with DLNA-supported devices, such as on your computer, pad and PS2/3/4.

- To share specific folders:
- 1. Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to USB Settings > Media Server.
- 4. Click Enable to enable the Media Server.

5. Click Add New Folder. Specify a name for the folder to be shared in the Share Name field. And select the folder you want to share.

6. Click Apply.

- To access the USB disk:
- 1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

@ Tips:

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage: Go to USB Settings > USB Mass Storage and click Disconnect.
- 2. Access the Media Files on Your USB Disk

Now the DLNA-supported devices (such as your computer and pad) connected to the router can detect and play the media files on the USB disk.

6. 6. 4. User Accounts

You can specify the username and password for Storage Sharing and FTP Server access.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > User Accounts.
- 3. Choose the Index for the account and specify a new username and password in the New Username and New Password fields, and reenter the password for confirmation.
- Note: For an account with Index 1, it is the Super User with full access to all active volumes and shared folders.

4. Click Set.

5. You can check the newly added account and also edit or delete the account.

6.7. System Tools

6.7.1. Diagnostic

Diagnostic is used to test the connectivity between the router and the host or other network devices.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Diagnostic.

- Diagnostic Tool Select one diagnostic tool.
 - Ping This diagnostic tool troubleshoots connectivity, reachability, and name resolution to a given host or gateway.
 - Tracerouter This diagnostic tool tests the performance of a connection.

Note: You can use ping/traceroute to test both numeric IP address or domain name. If pinging/tracerouting the IP address is successful, but pinging/tracerouting the domain name is not, you might have a name resolution problem. In this case, ensure that the domain name you are specifying can be resolved by using Domain Name System (DNS) queries.

- IP Address/Domain Name Enter the destination IP address (such as 192.168.0.1) or Domain name (such as www.tp-link.com).
- Pings Count The number of Ping packets for a Ping connection.
- Ping Packet Size The size of Ping packet.

- Ping Timeout Set the waiting time for the reply of each Ping packet. If there is no reply in the specified time, the connection is overtime.
- Traceroute Max TTL The max number of hops for a Traceroute connection.
- 3. Click Start to check the connectivity of the internet.
- 4. The Diagnostic Results page displays the diagnosis result. If the result is similar to the following figure, the connectivity of the internet is fine.

```
Diagnostic Results
Pinging 192.168.0.1 with 64 bytes of data:
Reply from 192.168.0.1: bytes=64 time=1
                                             TTL=64
Reply from 192.168.0.1: bytes=64 time=1
                                             TTL=64
                                                     sea=2
Reply from 192.168.0.1: bytes=64 time=1
                                             TTL=64 seq=3
Reply from 192.168.0.1: bytes=64 time=1
                                             TTL=64
                                                     sea=4
Ping statistics for 192.168.0.1
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss)
 Approximate round trip times in milliseconds:
Minimum = 1, Maximum = 1, Average = 1
```

Note: Only one user can use this tool at one time. Options "Number of Pings", "Ping Size" and "Ping Timeout" are used for the Ping function. Option "Tracert Hops" is used for the Tracert function.

6. 7. 2. Firmware Upgrade

TP-Link is dedicated to improving and richening the product features, giving users a better network experience. We will release the latest firmware at TP-Link official website. You can download the latest firmware file from the Support page of our website www.tp-link.com and upgrade the firmware to the latest version.

- 1. Download the latest firmware file for the router from our website www.tp-link.com.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to System Tools > Firmware Upgrade.
- 4. Click Choose File to locate the downloaded firmware file, and click Upgrade.

6.7.3. Factory Defaults

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- Go to System Tools > Factory Defaults. Click Restore to reset all settings to the default values.

• The default Username: admin

• The default Password: admin

The default IP Address: 192.168.0.254

The default Subnet Mask: 255.255.255.0

6.7.4. Backup & Restore

The configuration settings are stored as a configuration file in the router. You can backup the configuration file in your computer for future use and restore the router to the previous settings from the backup file when needed.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Backup & Restore.

• To backup configuration settings:

Click Backup to save a copy of the current settings in your local computer. A ".bin" file of the current settings will be stored in your computer.

- To restore configuration settings:
- 1. Click Choose File to locate the backup configuration file stored in your computer, and click Restore.
- 2. Wait a few minutes for the restoring and rebooting.

Note: During the restoring process, do not power off or reset the router.

6. 7. 5. Reboot

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Reboot, and you can restart your router.

Some settings of the router will take effect only after rebooting, including:

- Change the LAN IP address (system will reboot automatically).
- Change the DHCP settings.
- Change the operation mode.
- Change the web management port.
- Upgrade the firmware of the router (system will reboot automatically).
- Restore the router to its factory defaults (system will reboot automatically).
- Update the configuration with the file (system will reboot automatically).

6. 7. 6. Password

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Password, and you can change the factory default username and password of the router.

It is strongly recommended that you change the default username and password of the router, for all users that try to access the router's web-based utility or Quick Setup will be prompted for the router's username and password.

Note: The new username and password must not exceed 15 characters and not include any spacing.

3. Click Save.

6. 7. 7. System Log

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > System Log, and you can view the logs of the router.

- Refresh Refresh the page to show the latest log list.
- Clear Log All the logs will be deleted from the router permanently, not just from the page.
- Save Log Click to save all the logs in a txt file.

- Log Settings Click to set the logs in the screen.
 - Save Locally If Save Locally is selected, events will be recorded in the local memory.
 - Minimum Level Select the Minimum level in the drop-down list, for the Minimum Level, all logged events above or equal to the selected level will be displayed.
 - Save Remotely If Save Remotely is selected, events will be sent to the specified IP address and UDP port of the remote system log server.

6.8. Log Out

Click Logout at the bottom of the main menu, and you will log out of the web page and return to the login window.

Chapter 7

Configure the Router in Client Mode

This chapter presents how to configure the various features of the router working as a client.

It contains the following sections:

- Status
- Operation Mode
- Network
- Wireless
- DHCP
- System Tools
- Log Out

7. 1. Status

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Status. You can view the current status information of the router in Client Mode.

- Firmware Version The version information of the router's firmware.
- Hardware Version The version information of the router's hardware.
- LAN This field displays the current settings of the LAN, and you can configure them on the Network > LAN page.
 - MAC Address The physical address of the router.
 - IP Address The LAN IP address of the router.
 - Subnet Mask The subnet mask associated with the LAN IP address.

- Wireless 2.4GHz/5GHz This field displays the basic information or status of the wireless function, and you can configure them on the Wireless 2.4GHz/5GHz > Wireless Settings page.
 - Operation Mode The current operation mode of the router.
 - Wireless Radio Indicates whether the wireless feature is enabled or not.
 - Name (SSID) of Root AP The SSID of the connected host network.
 - Mode The current wireless working mode in use.
 - Channel The current wireless channel in use.
 - Channel Width The current wireless channel width in use.
 - MAC Address The physical address of the router.
- System Up Time The length of the time since the router was last powered on or reset.

Click Refresh to get the latest status and settings of the router.

7. 2. Operation Mode

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Operation Mode.
- 3. Select the operation mode as needed and click Save.

7.3. Network

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Network > LAN.
- 3. Configure the IP parameters of the LAN and click Save.

- LAN Type Either select Smart IP(DHCP) to get IP address from DHCP server, or Static
 IP to configure IP address manually.
- MAC Address The physical address of the LAN port. The value can not be changed.
- IP Address Enter the IP address in dotted-decimal notation if your select Static IP (factory default - 192.168.0.254).
- Subnet Mask An address code that determines the size of the network. Normally 255,255,255,0 is used as the subnet mask.

Note:

- If you have changed the IP address, you must use the new IP address to login.
- If you select Smart IP(DHCP), the DHCP server of the router will not start up.
- If the new IP address you set is not in the same subnet as the old one, the IP Address pool in the DHCP Server will be configured automatically, but the Virtual Server and DMZ Host will not take effect until they are re-configured.

7.4. Wireless

7. 4. 1. Wireless Settings

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Basic Settings.
- 3. Configure the settings for the host network you want to connect to and click Save.

Scan - Click to scan for wireless networks. When a host network is selected, the SSID,
 MAC Address and Security type will be automatically filled in.

 Password - Enter the password of the host network you want to connect to if it is encrypted.

7. 5. DHCP

By default, the DHCP (Dynamic Host Configuration Protocol) Server is enabled and the router acts as a DHCP server; it dynamically assigns TCP/IP parameters to client devices from the IP Address Pool. You can change the settings of DHCP Server if necessary, and you can reserve LAN IP addresses for specified client devices.

7. 5. 1. DHCP Settings

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to DHCP > DHCP Settings.
- 3. Specify DHCP server settings and click Save.

- DHCP Server Enable or disable the DHCP server. If disabled, you must have another DHCP server within your network or else you must configure the computer manually.
- Start IP Address Specify an IP address for the DHCP Server to start with when assigning IP addresses. 192.168.0.100 is the default start address.
- End IP Address Specify an IP address for the DHCP Server to end with when assigning IP addresses. 192.168.0.199 is the default end address.
- Address Lease Time The Address Lease Time is the amount of time a network user will be allowed to connect to the router with the current dynamic IP Address. When time is up, the user will be automatically assigned a new dynamic IP address. The range of the time is 1 ~ 2880 minutes. The default value is 120.
- Default Gateway (Optional) It is suggested to input the IP address of the LAN port of the router. The default value is 192.168.0.254.

- Default Domain (Optional) Input the domain name of your network.
- Primary DNS (Optional) Input the DNS IP address provided by your ISP.
- Secondary DNS (Optional) Input the IP address of another DNS server if your ISP provides two DNS servers.

■ Note: To use the DHCP server function of the router, you must configure all computers on the LAN as Obtain an IP Address automatically.

7. 5. 2. DHCP Client List

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to DHCP > DHCP Client List to view the information of the clients connected to the router.

- Client Name The name of the DHCP client.
- MAC Address The MAC address of the DHCP client.
- Assigned IP The IP address that the router has allocated to the DHCP client.
- Lease Time The time of the DHCP client leased. After the dynamic IP address has expired, a new dynamic IP address will be automatically assigned to the user.

You cannot change any of the values on this page. To update this page and show the current attached devices, click Refresh.

7. 6. USB Settings

You can insert a USB drive to share files among users on the LAN, access the USB drive remotely on the internet and enjoy videos and photos stored in the USB drive.

7. 6. 1. Storage Sharing

Share your USB storage device with different users on the network.

- To access the USB disk:
- 1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips:

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage:
 Go to USB Settings > USB Mass Storage and click Disconnect.

2. Access Your USB Disk

By default, all the network clients can access your USB disk. Refer to the following table for access instructions. You can customize user accounts by referring to <u>User Accounts</u>.

- To customize your settings:
- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > Storage Sharing.

- Server Status the Storage Sharing's current status.
- Anonymous access to all volumes This function is enabled by default, so users can
 access all activated volumes of Storage Sharing without accounts. If you want to add
 a shared folder which does not allow anonymous login, uncheck the box to disable
 this function. And Folder Table will be displayed as shown below.
- Share Name This folder's display name.
- Directory The real full path of the specified folder.
- User Access The authorization of the user is displayed. * users mean Super Users
 who have the full-access permission to all activated volumes and share folders. Grey
 users mean the users who have no right to use this function. Others are common
 users.
- Status The status of the entry is enabled or disabled.
- Edit Click Edit in the table, and then you can modify the entry.

7. 6. 2. FTP Server

You can share specific folders on you USB drive on the LAN or access your USB drive outside the local area network.

For example:

- Only share specific folders with clients on the LAN.
- Share photos and other large files with your friends without logging in to (and paying for) a photo-sharing site or email system.
- Get a safe backup for the material for a presentation.
- To set up your FTP server:

- 1. Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to USB Settings > FTP Server.
- 4. Click Enable to enable the FTP Server.
- 5. Click Enable to enable the internet access to the FTP server.
- 6. Specify a port number for the Service Port. The default value is 21.
- 7. Click Apply.
- To specify a folder to be accessed via the FTP server:
- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > FTP Server.
- 3. Click Add New Folder.
- 4. Specify a name for the folder to be shared in the Share Name field. And select the folder you want to share. And determine the access right of user accounts.

- 5. Click Apply.
- 6. You can check which folder is shared and also edit or delete the folder.

· To access the USB disk locally:

1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage: Go to USB Settings > USB Mass Storage and click Disconnect.

2. Access Your USB Disk Locally

Refer to the following table for access instructions. You can customize user accounts by referring to <u>User Accounts</u>.

• To access the USB disk remotely:

Refer to the following table for access instructions. You can customize user accounts by referring to <u>User Accounts</u>.

7. 6. 3. Media Server

The Media Server feature allows to view photos, play music and watch movies on the USB drive directly with DLNA-supported devices, such as on your computer, pad and PS2/3/4.

- To share specific folders:
- 1. Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to USB Settings > Media Server.
- 4. Click Enable to enable the Media Server.

5. Click Add New Folder. Specify a name for the folder to be shared in the Share Name field. And select the folder you want to share.

6. Click Apply.

- To access the USB disk:
- 1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips:

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage: Go to USB Settings > USB Mass Storage and click Disconnect.
- 2. Access the Media Files on Your USB Disk

Now the DLNA-supported devices (such as your computer and pad) connected to the router can detect and play the media files on the USB disk.

7. 6. 4. User Accounts

You can specify the username and password for Storage Sharing and FTP Server access.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > User Accounts.
- 3. Choose the Index for the account and specify a new username and password in the New Username and New Password fields, and reenter the password for confirmation.
- Note: For an account with Index 1, it is the Super User with full access to all active volumes and shared folders.

4. Click Set.

5. You can check the newly added account and also edit or delete the account.

7.7. System Tools

7. 7. 1. Diagnostic

Diagnostic is used to test the connectivity between the router and the host or other network devices.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Diagnostic.

- Diagnostic Tool Select one diagnostic tool.
 - Ping This diagnostic tool troubleshoots connectivity, reachability, and name resolution to a given host or gateway.
 - Tracerouter This diagnostic tool tests the performance of a connection.

Note: You can use ping/traceroute to test both numeric IP address or domain name. If pinging/tracerouting the IP address is successful, but pinging/tracerouting the domain name is not, you might have a name resolution problem. In this case, ensure that the domain name you are specifying can be resolved by using Domain Name System (DNS) queries.

- IP Address/Domain Name Enter the destination IP address (such as 192.168.0.1) or Domain name (such as www.tp-link.com).
- Pings Count The number of Ping packets for a Ping connection.
- Ping Packet Size The size of Ping packet.

- Ping Timeout Set the waiting time for the reply of each Ping packet. If there is no reply in the specified time, the connection is overtime.
- Traceroute Max TTL The max number of hops for a Traceroute connection.
- 3. Click Start to check the connectivity of the internet.
- 4. The Diagnostic Results page displays the diagnosis result. If the result is similar to the following figure, the connectivity of the Internet is fine.

```
Diagnostic Results

Pinging 192.168.0.1 with 64 bytes of data:

Reply from 192.168.0.1: bytes=64 time=1 TTL=64 seq=1
Reply from 192.168.0.1: bytes=64 time=1 TTL=64 seq=2
Reply from 192.168.0.1: bytes=64 time=1 TTL=64 seq=3
Reply from 192.168.0.1: bytes=64 time=1 TTL=64 seq=4

Ping statistics for 192.168.0.1
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss)
Approximate round trip times in milliseconds:
Minimum = 1, Maximum = 1, Average = 1
```

Note: Only one user can use this tool at one time. Options "Number of Pings", "Ping Size" and "Ping Timeout" are used for the Ping function. Option "Tracert Hops" is used for the Tracert function.

7. 7. 2. Firmware Upgrade

TP-Link is dedicated to improving and richening the product features, giving users a better network experience. We will release the latest firmware at TP-Link official website. You can download the latest firmware file from the Support page of our website www.tp-link.com and upgrade the firmware to the latest version.

- 1. Download the latest firmware file for the router from our website www.tp-link.com.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to System Tools > Firmware Upgrade.
- 4. Click Choose File to locate the downloaded firmware file, and click Upgrade.

7. 7. 3. Factory Defaults

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- Go to System Tools > Factory Defaults. Click Restore to reset all settings to the default values.

• The default Username: admin

The default Password: admin

The default IP Address: 192.168.0.254

The default Subnet Mask: 255.255.255.0

7. 7. 4. Backup & Restore

The configuration settings are stored as a configuration file in the router. You can backup the configuration file in your computer for future use and restore the router to the previous settings from the backup file when needed.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Backup & Restore.

To backup configuration settings:

Click Backup to save a copy of the current settings in your local computer. A ".bin" file of the current settings will be stored in your computer.

- To restore configuration settings:
- 1. Click Choose File to locate the backup configuration file stored in your computer, and click Restore.
- 2. Wait a few minutes for the restoring and rebooting.

Note: During the restoring process, do not power off or reset the router.

7. 7. 5. Reboot

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Reboot, and you can restart your router.

Some settings of the router will take effect only after rebooting, including:

- Change the LAN IP address (system will reboot automatically).
- Change the DHCP settings.
- Change the operation mode.
- Change the web management port.
- Upgrade the firmware of the router (system will reboot automatically).
- Restore the router to its factory defaults (system will reboot automatically).
- Update the configuration with the file (system will reboot automatically).

7. 7. 6. Password

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Password, and you can change the factory default username and password of the router.

It is strongly recommended that you change the default username and password of the router, for all users that try to access the router's web-based utility or Quick Setup will be prompted for the router's username and password.

- Note: The new username and password must not exceed 15 characters and not include any spacing.
- 3. Click Save.

7. 7. 7. System Log

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > System Log, and you can view the logs of the router.

- Refresh Refresh the page to show the latest log list.
- Clear Log All the logs will be deleted from the router permanently, not just from the page.
- Save Log Click to save all the logs in a txt file.
- Log Settings Click to set the logs in the screen.
 - Save Locally If Save Locally is selected, events will be recorded in the local memory.
 - Minimum Level Select the Minimum level in the drop-down list, for the Minimum Level, all logged events above or equal to the selected level will be displayed.
 - Save Remotely If Save Remotely is selected, events will be sent to the specified IP address and UDP port of the remote system log server.

7. 8. Log Out

Click Logout at the bottom of the main menu, and you will log out of the web page and return to the login window.

Chapter 8

Configure the Router in Hotspot Router Mode

This chapter presents how to configure the various features of the router working as a hotspot router.

It contains the following sections:

- Status
- Network
- Wireless
- Guest Network
- DHCP
- USB Settings
- Port Forwarding
- Security
- Parental Controls

- Access Control
- Advanced Routing
- Bandwidth Control
- IP&MAC Binding
- Dynamic DNS
- System Tools
- Log Out

8. 1. Status

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Status. You can view the current status information of the router.

- Firmware Version The version information of the router's firmware.
- Hardware Version The version information of the router's hardware.
- LAN This field displays the current settings of the LAN, and you can configure them on the Network > LAN page.

- MAC Address The physical address of the router.
- IP Address The LAN IP address of the router.
- Subnet Mask The subnet mask associated with the LAN IP address.
- Wireless 2.4GHz/5GHz This field displays the basic information or status of the wireless function, and you can configure them on the Wireless 2.4GHz/5GHz > Basic Settings page.
 - Operation Mode The current operation mode of the router.
 - Wireless Radio Indicates whether the wireless feature is enabled or not.
 - Name (SSID) The SSID of the network.
 - Mode The current wireless working mode in use.
 - Channel Width The current wireless channel width in use.
 - Channel The current wireless channel in use.
 - MAC Address The physical address of the router.
- WAN This field displays the current settings of the WAN, and you can configure them on the Network > WAN page.
 - MAC Address The physical address of the WAN port.
 - IP Address The current WAN (Internet) IP Address. This field will be blank or 0.0.0.0 if the IP Address is assigned dynamically and there is no internet connection.
 - Subnet Mask The subnet mask associated with the WAN IP Address.
 - Default Gateway The Gateway currently used is shown here. When you use
 Dynamic IP as the internet connection type.
 - DNS Server The IP addresses of DNS (Domain Name System) server.
- System Up Time The length of the time since the router was last powered on or reset.

Click Refresh to get the latest status and settings of the router.

8. 2. Network

8. 2. 1. WAN

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Network > WAN.
- 3. Configure the IP parameters of the LAN and click Save.

Dynamic IP

If your ISP provides the DHCP service, please select Dynamic IP, and the router will automatically get IP parameters from your ISP.

Click Renew to renew the IP parameters from your ISP.

Click Release to release the IP parameters.

- MTU(Bytes) The normal MTU (Maximum Transmission Unit) value for most Ethernet networks is 1500 Bytes. It is not recommended that you change the default MTU size unless required by your ISP.
- IGMP Proxy Select to enable the IGMP Proxy feature if the IPTV service provided by the ISP is IGMP technology-based.
- Get IP with Unicast DHCP A few ISPs' DHCP servers do not support the broadcast applications. If you cannot get the IP address normally, you can choose this option. (It is rarely required.)
- Set DNS server manually If your ISP provides you one or two DNS addresses, select Set DNS server manually and enter the primary and secondary addresses. Otherwise, the DNS servers will be assigned dynamically from your ISP.
- Host Name This option specifies the name of the router.

Static IP

If your ISP provides a static or fixed IP address, subnet mask, default gateway and DNS setting, please select Static IP.

- IP Address Enter the IP address in dotted-decimal notation provided by your ISP.
- Subnet Mask Enter the subnet mask in dotted-decimal notation provided by your ISP. Normally 255.255.255.0 is used as the subnet mask.
- Gateway Enter the gateway IP address in dotted-decimal notation provided by your ISP.
- Primary/Secondary DNS Server (Optional) Enter one or two DNS addresses in dotted-decimal notation provided by your ISP.
- MTU(Bytes) The default MTU size is 1480 bytes. It is not recommended that you change the default MTU size unless required by your ISP.
- IGMP Proxy Select to enable the IGMP Proxy feature if the IPTV service provided by the ISP is IGMP technology-based.

PPPoE/Russia PPPoE

If your ISP provides PPPoE connection, select PPPoE/Russia PPPoE.

PPP Username/Password - Enter the username and password provided by your ISP.
 These fields are case-sensitive.

- Confirm Password Enter the Password provided by your ISP again to ensure the password you entered is correct.
- Secondary Connection It's available only for PPPoE connection. If your ISP provides an extra connection type, select Dynamic IP or Static IP to activate the secondary connection.
- Connection Mode
 - Always On Connect automatically after the router is connected.
 - Connect on demand In this mode, the internet connection can be terminated
 automatically after a specified inactivity period (Max Idle Time) and be reestablished when you attempt to access the Internet again. If you want to keep
 your Internet connection active all the time, please enter 0 in the Max Idle Time
 field. Otherwise, enter the number of minutes you want to have elapsed before
 your Internet access disconnects.
 - Connect manually You can click Connect/Disconnect to connect/disconnect immediately. This mode also supports the Max Idle Time function as Connect on demand mode. The internet connection can be disconnected automatically after a specified inactivity period (Max Idle Time) and not be able to re-establish when you attempt to access the internet again.

Note:

- Only when you have configured the system time on the System Tools > Time Settings page, will the time-based connecting function take effect.
- Sometimes the connection cannot be terminated although you have specified the Max Idle Time because some applications are visiting the Internet continually in the background.

If you want to do some advanced configurations, please click Advanced.

- Service Name/Server Name The service name and server name should not be configured unless you are sure it is necessary for your ISP. In most cases, leaving these fields blank will work.
- MTU(Bytes) The default MTU size is 1480 bytes. It is not recommended that you change the default MTU size unless required by your ISP.
- IGMP Proxy Select to enable the IGMP Proxy feature if the IPTV service provided by the ISP is IGMP technology-based.

- Use IP address specified by ISP If your ISP does not automatically assign IP addresses
 to the router, please select Use IP address specified by ISP and enter the IP address
 provided by your ISP in dotted-decimal notation.
- Set DNS server manually If your ISP does not automatically assign DNS addresses to the router, please select Set DNS server manually and enter the IP address in dotteddecimal notation of your ISP's primary DNS server. If a secondary DNS server address is available, enter it as well.

BigPond Cable

If your ISP provides BigPond cable connection, please select BigPond Cable.

- Username/Password Enter the username and password provided by your ISP. These fields are case-sensitive.
- Auth Server Enter the authenticating server IP address or host name.
- Auth Domain Type in the domain suffix server name based on your location.
- MTU(Bytes) The default MTU size is 1480 bytes. It is not recommended that you change the default MTU size unless required by your ISP.
- IGMP Proxy Select to enable the IGMP Proxy feature if the IPTV service provided by the ISP is IGMP technology-based.
- Connection Mode
 - Always On Connect automatically after the router is connected.
 - Connect on demand In this mode, the internet connection can be terminated automatically after a specified inactivity period (Max Idle Time) and be reestablished when you attempt to access the Internet again. If you want to keep your internet connection active all the time, please enter 0 in the Max Idle Time field. Otherwise, enter the number of minutes you want to have elapsed before your Internet access disconnects.

 Connect manually - You can click Connect/Disconnect to connect/disconnect immediately. This mode also supports the Max Idle Time function as Connect on demand mode. The internet connection can be disconnected automatically after a specified inactivity period (Max Idle Time) and not be able to re-establish when you attempt to access the internet again.

Note: Sometimes the connection cannot be terminated although you have specified the Max Idle Time because some applications are visiting the Internet continually in the background.

L2TP

If your ISP provides L2TP connection, please select L2TP.

- Username/Password Enter the username and password provided by your ISP. These fields are case-sensitive.
- Confirm Password Enter the Password provided by your ISP again to ensure the password you entered is correct.
- Connect/Disconnect Click this button to connect or disconnect immediately.
- Addressing Type Select either as required by your ISP. If Static IP is selected, please enter the IP address, subnet marsk, gateway and DNS also provided by your ISP.
- Internet IP Address/ Internet DNS The internet IP address and DNS server address assigned by L2TP server.
- MTU(Bytes) The default MTU size is 1480 bytes. It is not recommended that you change the default MTU size unless required by your ISP.

- IGMP Proxy Select to enable the IGMP Proxy feature if the IPTV service provided by the ISP is IGMP technology-based.
- Connection Mode
 - Always On Connect automatically after the router is connected.
 - Connect on demand In this mode, the internet connection can be terminated automatically after a specified inactivity period (Max Idle Time) and be reestablished when you attempt to access the Internet again. If you want to keep your Internet connection active all the time, please enter 0 in the Max Idle Time field. Otherwise, enter the number of minutes you want to have elapsed before your Internet access disconnects.
 - Connect manually You can click Connect/Disconnect to connect/disconnect immediately. This mode also supports the Max Idle Time function as Connect on demand mode. The internet connection can be disconnected automatically after a specified inactivity period (Max Idle Time) and not be able to re-establish when you attempt to access the Internet again.
- Note: Sometimes the connection cannot be terminated although you have specified the Max Idle Time because some applications are visiting the Internet continually in the background.

PPTP

If your ISP provides PPTP connection, please select PPTP.

 Username/Password - Enter the username and password provided by your ISP. These fields are case-sensitive.

- Confirm Password Enter the Password provided by your ISP again to ensure the password you entered is correct.
- Connect/Disconnect Click this button to connect or disconnect immediately.
- Addressing Type Select either as required by your ISP. If Static IP is selected, please enter the IP address, subnet marsk, gateway and DNS also provided by your ISP.
- Internet IP Address/ Internet DNS The internet IP address and DNS server address assigned by L2TP server.
- MTU(Bytes) The default MTU size is 1480 bytes. It is not recommended that you change the default MTU size unless required by your ISP.
- IGMP Proxy Select to enable the IGMP Proxy feature if the IPTV service provided by the ISP is IGMP technology-based.
- Connection Mode
 - Always On Connect automatically after the router is connected.
 - Connect on demand In this mode, the internet connection can be terminated
 automatically after a specified inactivity period (Max Idle Time) and be reestablished when you attempt to access the Internet again. If you want to keep
 your Internet connection active all the time, please enter 0 in the Max Idle Time
 field. Otherwise, enter the number of minutes you want to have elapsed before
 your Internet access disconnects.
 - Connect manually You can click Connect/Disconnect to connect/disconnect immediately. This mode also supports the Max Idle Time function as Connect on demand mode. The internet connection can be disconnected automatically after a specified inactivity period (Max Idle Time) and not be able to re-establish when you attempt to access the Internet again.

Note: Sometimes the connection cannot be terminated although you have specified the Max Idle Time because some applications are visiting the Internet continually in the background.

8. 2. 2. LAN

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Network > LAN.
- 3. Configure the IP parameters of the LAN and click Save.

- MAC Address The physical address of the LAN ports. The value can not be changed.
- IP Address Enter the IP address in dotted-decimal notation of your router (factory default 192.168.0.254).
- Subnet Mask An address code that determines the size of the network. Normally 255.255.255.0 is used as the subnet mask.

Note

- If you have changed the IP address, you must use the new IP address to log in.
- If the new IP address you set is not in the same subnet as the old one, the IP address pool in the DHCP Server will be configured automatically, but the Virtual Server and DMZ Host will not take effect until they are re-configured.

8. 2. 3. MAC Clone

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Network > MAC Clone.
- 3. Configure the WAN MAC address and click Save.

- WAN MAC Address This field displays the current MAC address of the WAN port.
 If your ISP requires you to register the MAC address, please enter the correct MAC address in this field. Click Restore Factory MAC to restore the MAC address of WAN port to the factory default value.
- Your PC's MAC Address This field displays the MAC address of the PC that is managing the router. If the MAC address is required, you can click Clone MAC Address and this MAC address will be filled in the WAN MAC Address field.

Note:

- You can only use the MAC Address Clone function for PCs on the LAN.
- If you have changed the WAN MAC address when the WAN connection is PPPoE, it will not take effect until the connection is re-established.

8.3. Wireless

8. 3. 1. Basic Settings

- Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Basic Settings.
- 3. Configure the basic settings for the 2.4GHz/5GHz wireless network and click Save.

In the Client Setting section, you can change the settings for the public Wi-Fi that you want to connect to.

- Scan Click to scan for wireless networks. When a public Wi-Fi is selected, the SSID, MAC Address and other parameters except Wireless Password will be automatically filled in.
- Wireless Password Enter the password of the public Wi-Fi you want to connect to.

In the AP Setting, you can change the settings for your 2.4GHz/5GHz wireless network.

- Wireless Network Name Enter a string of up to 32 characters. The default SSID is TP-Link_XXXX (XXXX indicates the last unique four numbers of each router's MAC address). It is strongly recommended that you change your network name (SSID). This value is case-sensitive. For example, TEST is NOT the same as test.
- Mode Select the desired mode. It is strongly recommended that you keep the default setting 11bgn mixed or 11a/n/ac mixed.

- Channel This field determines which operating frequency will be used. The default channel is set to Auto. It is not necessary to change the wireless channel unless you notice interference problems with another nearby access point.
- Channel Width Select any channel width from the drop-down list. The default setting is Auto, which can automatically adjust the channel width for your clients.
- Enable SSID Broadcast If enabled, the router will broadcast the wireless network name (SSID).

8. 3. 2. WPS

WPS (Wi-Fi Protected Setup) can help you to quickly and securely connect to a network. This section will guide you to add a new wireless device to your router's network quickly via WPS.

- Note: The WPS function cannot be configured if the wireless function of the router is disabled. Please make sure the wireless function is enabled before configuration.
- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > WPS.
- 3. Follow one of the following three methods to connect your client device to the router's Wi-Fi network.

Method ONE: Press the WPS Button on Your Client Device

1. Keep the WPS Status as Enabled and click Add device.

2. Select Press the button of the new device in two minutes and click Connect.

- 3. Within two minutes, press the WPS button on your client device.
- 4. A success message will appear on the WPS page if the client device has been successfully added to the router's network.

Method TWO: Enter the Client's PIN

1. Keep the WPS Status as Enabled and click Add device.

2. Select Enter new device PIN, enter your client device's current PIN in the PIN filed and click Connect.

3. A success message will appear on the WPS page if the client device has been successfully added to the router's network.

Method Three: Enter the Router's PIN

1. Keep the WPS Status as Enabled and get the Current PIN of the router.

2. Enter the router's current PIN on your client device to join the router's Wi-Fi network.

8. 3. 3. Wireless Security

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Wireless Security.
- 3. Configure the security settings of your 2.4GHz/5GHz wireless network and click Save.

- Disable Wireless Security The wireless security function can be enabled or disabled. If disabled, wireless clients can connect to the router without a password. It's strongly recommended to choose one of the following modes to enable security.
- WPA/WPA2-Personal It's the WPA/WPA2 authentication type based on pre-shared passphrase.
 - Version Select Auto, WPA-PSK or WPA2-PSK.
 - Encryption Select Auto, TKIP or AES.
 - Wireless Password Enter ASCII or Hexadecimal characters. For Hexadecimal, the length should be between 8 and 64 characters; for ASCII, the length should be between 8 and 63 characters.
 - Group Key Update Period Specify the group key update interval in seconds. The value can be 0 or at least 30. Enter 0 to disable the update.
- WPA/WPA2-Enterprise It's based on Radius Server.
 - Version Select Auto, WPA or WPA2.
 - Encryption Select Auto, TKIP or AES.
 - Radius Server IP Enter the IP address of the Radius server.

- Radius Port Enter the port that Radius server used.
- Radius Password Enter the password for the Radius server.
- Group Key Update Period Specify the group key update interval in seconds. The value should be 30 or above. Enter 0 to disable the update.
- WEP It is based on the IEEE 802.11 standard.
 - Type The default setting is Auto, which can select Shared Key or Open System authentication type automatically based on the wireless client's capability and request.
 - WEP Key Format Hexadecimal and ASCII formats are provided here.
 Hexadecimal format stands for any combination of hexadecimal digits (0-9, a-f, A-F) in the specified length. ASCII format stands for any combination of keyboard characters in the specified length.
 - WEP Key (Password) Select which of the four keys will be used and enter the matching WEP key. Make sure these values are identical on all wireless clients in your network.
 - Key Type Select the WEP key length (64-bit, 128-bit or 152-bit) for encryption.
 Disabled means this WEP key entry is invalid.
 - 64-bit Enter 10 hexadecimal digits (any combination of 0-9, a-f and A-F. Null key is not permitted) or 5 ASCII characters.
 - 128-bit Enter 26 hexadecimal digits (any combination of 0-9, a-f and A-F. Null key is not permitted) or 13 ASCII characters.
 - 152-bit Enter 32 hexadecimal digits (any combination of 0-9, a-f and A-F. Null key is not permitted) or 16 ASCII characters.

8. 3. 4. Wireless MAC Filtering

Wireless MAC Filtering is used to deny or allow specific wireless client devices to access your network by their MAC addresses.

I want to:

Deny or allow specific wireless client devices to access my network by their MAC addresses.

For example, you want the wireless client A with the MAC address 00:0A:EB:B0:00:0B and the wireless client B with the MAC address 00:0A:EB:00:07:5F to access the router, but other wireless clients cannot access the router.

How can I do that?

1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.

- 2. Go to Wireless 2.4GHz/5GHz > Wireless MAC Filtering.
- 3. Click Enable to enable the Wireless MAC Filtering function.
- 4. Select Allow the stations specified by any enabled entries in the list to access as the filtering rule.
- 5. Delete or disable all entries if there are any entries already.
- 6. Click Add New and fill in the blanks.

- 1) Enter the MAC address 00:0A:EB:B0:00:0B/00:0A:EB:00:07:5F in the MAC Address field.
- 2) Enter Client A/B in the Description field.
- 3) Leave the status as Enabled.
- 4) Click Save and click Back.
- 7. The configured filtering rules should be listed as the picture shows below.

Done! Now only client A and client B can access your network.

8. 3. 5. Wireless Advanced

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Wireless Advanced.
- 3. Configure the advanced settings of your wireless network and click Save.

Note: If you are not familiar with the setting items on this page, it's strongly recommended to keep the provided default values; otherwise it may result in lower wireless network performance.

- Transmit Power Select High, Middle or Low which you would like to specify for the router. High is the default setting and recommended.
- Beacon Interval Enter a value between 40-1000 milliseconds for Beacon Interval here. Beacon Interval value determines the time interval of the beacons. The beacons are the packets sent by the router to synchronize a wireless network. The default value is 100.
- RTS Threshold Here you can specify the RTS (Request to Send) Threshold. If the
 packet is larger than the specified RTS Threshold size, the router will send RTS frames
 to a particular receiving station and negotiate the sending of a data frame. The default
 value is 2346.
- Fragmentation Threshold This value is the maximum size determining whether
 packets will be fragmented. Setting a low value for the Fragmentation Threshold may
 result in poor network performance because of excessive packets. 2346 is the default
 setting and is recommended.
- DTIM Interval This value determines the interval of the Delivery Traffic Indication Message (DTIM). A DTIM field is a countdown field informing clients of the next window for listening to broadcast and multicast messages. When the router has buffered broadcast or multicast messages for associated clients, it sends the next DTIM with a DTIM Interval value. You can specify the value between 1-255 Beacon Intervals. The default value is 1, which indicates the DTIM Interval is the same as Beacon Interval.
- Enable Short GI It is recommended to enable this function, for it will increase the data capacity by reducing the guard interval time.
- Enable Client Isolation This function isolates all connected wireless stations so that wireless stations cannot access each other through WLAN. This function will be disabled if WDS/Bridge is enabled.
- Enable WMM WMM function can guarantee the packets with high-priority messages being transmitted preferentially. It is strongly recommended to enable this function.

8. 3. 6. Wireless Statistics

- Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Wireless 2.4GHz/5GHz > Wireless Statistics to check the data packets sent and received by each client device connected to the router.

- MAC Address The MAC address of the connected wireless client.
- Current Status The running status of the connected wireless client.
- Received Packets Packets received by the wireless client.
- Sent Packets Packets sent by the wireless client.
- SSID SSID that the wireless client is connected to.

8. 4. Guest Network

Guest Network allows you to provide Wi-Fi access for guests without disclosing your main network. When you have guests in your home, apartment, or workplace, you can create a guest network for them.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Guest Network.

 Allow Guests To Access My Local Network - If enabled, guests can communicate with hosts.

- Guest Network Isolation If enabled, one guest can not communicate with another.
- Guest Network Bandwidth Control If enabled, the Guest Network Bandwidth Control rules will take effect.
- Band Select Select the wireless band 2.4GHz or 5GHz for the guest network.
- Guest Network Enable or disable the guest network.
- Network Name Enter a value of up to 32 characters. The same Name(SSID) must be assigned to all wireless devices in your guest network.
- Max Guests number Maximum guests (1-32).
- Security You can configure the security of the guest network here.
- Access Time You can also specify when or how long a guest device can access the internet.
 - Schedule During this time the wireless stations could not access the guest network.

Timeout - If the countdown timer hits zero, the guest network will be closed.

8. 5. DHCP

By default, the DHCP (Dynamic Host Configuration Protocol) Server is enabled and the router acts as a DHCP server; it dynamically assigns TCP/IP parameters to client devices from the IP Address Pool. You can change the settings of DHCP Server if necessary, and you can reserve LAN IP addresses for specified client devices.

8. 5. 1. DHCP Settings

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to DHCP > DHCP Settings.
- 3. Specify DHCP server settings and click Save.

- DHCP Server Enable or disable the DHCP server. If disabled, you must have another DHCP server within your network or else you must configure the computer manually.
- Start IP Address Specify an IP address for the DHCP Server to start with when assigning IP addresses. 192.168.0.100 is the default start address.
- End IP Address Specify an IP address for the DHCP Server to end with when assigning IP addresses. 192.168.0.199 is the default end address.
- Lease Time The Address Lease Time is the amount of time a network user will be allowed to connect to the router with the current dynamic IP Address. When time is up, the router will automatically assign the same IP address to the user. The range of the time is 1 ~ 2880 minutes. The default value is 120.
- Default Gateway (Optional) It is suggested to input the IP address of the LAN port of the Router. The default value is 192.168.0.254.
- Default Domain (Optional) Input the domain name of your network.
- Primary DNS (Optional) Input the DNS IP address provided by your ISP.
- Secondary DNS (Optional) Input the IP address of another DNS server if your ISP provides two DNS servers.

Note: To use the DHCP server function of the router, you must configure all computers on the LAN as Obtain an IP Address automatically.

8. 5. 2. DHCP Client List

1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.

2. Go to DHCP > DHCP Client List to view the information of the clients connected to the router.

- Client Name The name of the DHCP client.
- MAC Address The MAC address of the DHCP client.
- Assigned IP The IP address that the router has allocated to the DHCP client.
- Lease Time The time of the DHCP client leased. After the dynamic IP address has expired, a new dynamic IP address will be automatically assigned to the user.

You cannot change any of the values on this page. To update this page and show the current connected devices, click Refresh.

8. 5. 3. Address Reservation

You can reserve an IP address for a specific client. When you have specified a reserved IP address for a PC on the LAN, this PC will always receive the same IP address each time when it accesses the DHCP server.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to DHCP > Address Reservation.
- 3. Click Add New and fill in the blanks.

- 1) Enter the MAC address (in XX:XX:XX:XX:XX format) of the client for which you want to reserve an IP address.
- 2) Enter the IP address (in dotted-decimal notation) which you want to reserve for the client.
- 3) Leave the status as Enabled.

4) Click Save.

8. 6. USB Settings

You can insert a USB drive to share files among users on the LAN, access the USB drive remotely on the internet and enjoy videos and photos stored in the USB drive.

8. 6. 1. Storage Sharing

Share your USB storage device with different users on the network.

To access the USB disk:

1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage:
 Go to USB Settings > USB Mass Storage and click Disconnect.

2. Access Your USB Disk

By default, all the network clients can access your USB disk. Refer to the following table for access instructions. You can customize user accounts by referring to <u>User Accounts</u>.

- To customize your settings:
- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > Storage Sharing.

- Server Status the Storage Sharing's current status.
- Anonymous access to all volumes This function is enabled by default, so users can access all activated volumes of Storage Sharing without accounts. If you want to add

a shared folder which does not allow anonymous login, uncheck the box to disable this function. And Folder Table will be displayed as shown below.

- Share Name This folder's display name.
- Directory The real full path of the specified folder.
- User Access The authorization of the user is displayed. * users mean Super Users
 who have the full-access permission to all activated volumes and share folders. Grey
 users mean the users who have no right to use this function. Others are common
 users.
- Status The status of the entry is enabled or disabled.
- Edit Click Edit in the table, and then you can modify the entry.

8. 6. 2. FTP Server

You can share specific folders on you USB drive on the LAN or access your USB drive outside the local area network.

For example:

- Only share specific folders with clients on the LAN.
- Share photos and other large files with your friends without logging in to (and paying for) a photo-sharing site or email system.
- Get a safe backup for the material for a presentation.
- To set up your FTP server:

```
FIP Server Settings

Server States. Lincolded [ Hardward ]

I de not Access. © Disable () Disable

I de not Access. © 0.000

Single Park [ 21 | (150 constant 25 Lie not monthly interes reconstant))
```

- 1. Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to USB Settings > FTP Server.
- 4. Click Enable to enable the FTP Server.
- 5. Click Enable to enable the internet access to the FTP server.
- 6. Specify a port number for the Service Port. The default value is 21.
- 7. Click Apply.
- To specify a folder to be accessed via the FTP server:

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > FTP Server.
- 3. Click Add New Folder.
- 4. Specify a name for the folder to be shared in the Share Name field. And select the folder you want to share. And determine the access right of user accounts.

- 5. Click Apply.
- 6. You can check which folder is shared and also edit or delete the folder.

- To access the USB disk locally:
- 1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips:

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage: Go to USB Settings > USB Mass Storage and click Disconnect.
- 2. Access Your USB Disk Locally

Refer to the following table for access instructions. You can customize user accounts by referring to User Accounts.

To access the USB disk remotely:

Refer to the following table for access instructions. You can customize user accounts by referring to <u>User Accounts</u>.

8. 6. 3. Media Server

The Media Server feature allows to view photos, play music and watch movies on the USB drive directly with DLNA-supported devices, such as on your computer, pad and PS2/3/4.

- To share specific folders:
- 1. Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to USB Settings > Media Server.
- 4. Click Enable to enable the Media Server.

5. Click Add New Folder. Specify a name for the folder to be shared in the Share Name field. And select the folder you want to share.

6. Click Apply.

- To access the USB disk:
- 1. Connect Your USB Disk

Insert your USB storage device into the router's USB port directly or using a USB cable. Wait several seconds until the USB LED becomes solid on.

Tips:

- If you use USB hubs, make sure no more than 2 devices are connected to the router.
- If the USB storage device requires using bundled external power, make sure the external power has been connected.
- If you use a USB hard drive, make sure its file system is FAT32 or NTFS.
- Before you physically disconnect a USB device from the router, safely remove it to avoid data damage: Go to USB Settings > USB Mass Storage and click Disconnect.
- 2. Access the Media Files on Your USB Disk

Now the DLNA-supported devices (such as your computer and pad) connected to the router can detect and play the media files on the USB disk.

8. 6. 4. User Accounts

You can specify the username and password for Storage Sharing and FTP Server access.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to USB Settings > User Accounts.
- 3. Choose the Index for the account and specify a new username and password in the New Username and New Password fields, and reenter the password for confirmation.
- Note: For an account with Index 1, it is the Super User with full access to all active volumes and shared folders.

4. Click Set.

The paper description and according through the format and the transaction products are obtained.

The paper description and according through the format and the transaction products are obtained.

The paper description are according to the paper description and the paper description are obtained.

The paper description are according to the paper description and the paper description are obtained as the paper

5. You can check the newly added account and also edit or delete the account.

8.7. Port Forwarding

The router's NAT (Network Address Translation) feature makes the devices on the LAN use the same public IP address to communicate in the Internet, which protects the local network by hiding IP addresses of the devices. However, it also brings about the problem that external hosts cannot initiatively communicate with the specified devices in the local network.

With the forwarding feature, the router can traverse the isolation of NAT so that clients on the Internet can reach devices on the LAN and realize some specific functions.

The TP-Link router includes four forwarding rules. If two or more rules are set, the priority of implementation from high to low is Virtual Servers, Port Triggering, UPNP and DMZ.

8.7.1. Virtual Servers

When you build up a server in the local network and want to share it on the Internet, Virtual Servers can realize the service and provide it to Internet users. At the same time virtual servers can keep the local network safe as other services are still invisible from the Internet.

Virtual Servers can be used to set up public services in your local network, such as HTTP, FTP, DNS, POP3/SMTP and Telnet. Different service uses different service port. Port 80 is used in HTTP service, port 21 in FTP service, port 25 in SMTP service and port 110 in POP3 service. Please verify the service port number before the configuration.

I want to:

Share my personal website I've built in local network with my friends through the Internet.

For example, the personal website has been built in my home PC (192.168.0.100). I hope that my friends on the Internet can visit my website in some way. My PC is connected to the router with the WAN IP address 218.18.232.154.

How can I do that?

- 1. Set your PC to a static IP address, for example 192.168.0.100.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to Forwarding > Virtual Servers.
- 4. Click Add New. Select HTTP from the Common Service Port list. The service port, internal port and protocol will be automatically filled in. Enter the PC's IP address 192.168.0.100 in the IP Address field.

5. Leave the status as Enabled and click Save.

Note:

- It is recommended to keep the default settings of Internal Port and Protocol if you are not clear about which port and protocol to use.
- If the service you want to use is not in the Common Service Port list, you can enter the corresponding parameters manually. You should verify the port number that the service needs.
- You can add multiple virtual server rules if you want to provide several services in a router. Please note that the Service Port should not be overlapped.

Done!

Users on the Internet can enter http:// WAN IP (in this example: http:// 218.18.232.154) to visit your personal website.

Note:

- If you have changed the default Service Port, you should use http:// WAN IP: Service Port to visit the website.
- Some specific service ports are forbidden by the ISP, if you fail to visit the website, please use another service port.

8. 7. 2. Port Triggering

Port triggering can specify a triggering port and its corresponding external ports. When a host in the local network initiates a connection to the triggering port, all the external ports will be opened for subsequent connections. The router can record the IP address of the host. When the data from the Internet return to the external ports, the router can forward them to the corresponding host. Port triggering is mainly applied to online games, VoIPs, video players and common applications including MSN Gaming Zone, Dialpad, Quick Time 4 players and more.

Follow the steps below to configure the port triggering rules:

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Forwarding > Port Triggering.
- 3. Click Add New. Select the desired application from the Common Applications list. The trigger port amd incoming ports will be automatically filled in. The following picture takes application MSN Gaming Zone as an example.

4. Leave the status as Enabled and click Save.

Note:

- You can add multiple port triggering rules as needed.
- The triggering ports can not be overlapped.
- If the application you need is not listed in the Common Applications list, please enter the parameters manually. You should verify the incoming ports the application uses first and enter them in Incoming Ports field. You can input at most 5 groups of ports (or port sections). Every group of ports must be set apart with ",". For example, 2000-2038, 2050-2051, 2085, 3010-3030.

8. 7. 3. DMZ

When a PC is set to be a DMZ (Demilitarized Zone) host in the local network, it is totally exposed to the Internet, which can realize the unlimited bidirectional communication between internal hosts and external hosts. The DMZ host becomes a virtual server with all ports opened. When you are not clear about which ports to open in some special applications, such as IP camera and database software, you can set the PC to be a DMZ host.

Note: DMZ is more applicable in the situation that users are not clear about which ports to open. When it is enabled, the DMZ host is totally exposed to the Internet, which may bring some potential safety hazards. If DMZ is not in use, please disable it in time.

I want to:

Make the home PC join the Internet online game without port restriction.

For example, due to some port restriction, when playing the online games, you can log in normally but cannot join a team with other players. To solve this problem, set your PC as a DMZ host with all ports opened.

How can I do that?

- 1. Assign a static IP address to your PC, for example 192.168.0.100.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to Forwarding > DMZ.
- **4.** Select Enable and enter the IP address 192.168.0.100 in the DMZ Host IP Address filed.

5. Click Save.

Done!

You've set your PC to a DMZ host and now you can make a team to game with other players.

8. 7. 4. UPnP

The UPnP (Universal Plug and Play) protocol allows the applications or host devices to automatically find the front-end NAT device and send request to it to open the corresponding ports. With UPnP enabled, the applications or host devices on the local network and the Internet can freely communicate with each other realizing the seamless connection of the network. You may need to enable the UPnP if you want to use applications for multiplayer gaming, peer-to-peer connections, real-time communication (such as VoIP or telephone conference) or remote assistance, etc.

- Tips:
- UPnP is enabled by default in this router.
- Only the application supporting UPnP protocol can use this feature.

• UPnP feature needs the support of operating system (e.g. Windows Vista/ Windows 7/ Windows 8, etc. Some of operating system need to install the UPnP components).

For example, when you connect your Xbox to the router which is connected to the Internet to play online games, UPnP will send request to the router to open the corresponding ports allowing the following data penetrating the NAT to transmit. Therefore, you can play Xbox online games without a hitch.

If necessary, you can follow the steps to change the status of UPnP.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Forwarding > UPnP.
- 3. Click Disable or Enable according to your needs.

8.8. Security

This function allows you to protect your home network from cyber attacks and unauthorized users by implementing these network security functions.

8. 8. 1. Basic Security

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Security > Basic Security, and you can enable or disable the security functions.

- Firewall A firewall protects your network from Internet attacks.
 - SPI Firewall SPI (Stateful Packet Inspection, also known as dynamic packet filtering) helps to prevent cyber attacks by tracking more state per session. It validates that the traffic passing through the session conforms to the protocol. SPI Firewall is enabled by default.
- VPN VPN Passthrough must be enabled if you want to allow VPN tunnels using IPSec,
 PPTP or L2TP protocols to pass through the router's firewall.
 - PPTP Passthrough Point-to-Point Tunneling Protocol (PPTP) allows the Point-to-Point Protocol (PPP) to be tunneled through an IP network. If you want to allow PPTP tunnels to pass through the router, you can keep the default (Enabled).
 - L2TP Passthrough Layer 2 Tunneling Protocol (L2TP) is the method used to enable Point-to-Point sessions via the Internet on the Layer 2 level. If you want to allow L2TP tunnels to pass through the router, you can keep the default (Enabled).
 - IPSec Passthrough Internet Protocol Security (IPSec) is a suite of protocols for ensuring private, secure communications over Internet Protocol (IP) networks, through the use of cryptographic security services. If you want to allow IPSec tunnels to pass through the router, you can keep the default (Enabled).
- ALG It is recommended to enable Application Layer Gateway (ALG) because ALG allows customized Network Address Translation (NAT) traversal filters to be plugged

into the gateway to support address and port translation for certain application layer "control/data" protocols such as FTP, TFTP, H323 etc.

- FTP ALG To allow FTP clients and servers to transfer data across NAT, keep the default Enable.
- TFTP ALG To allow TFTP clients and servers to transfer data across NAT, keep the default Enable.
- H323 ALG To allow Microsoft NetMeeting clients to communicate across NAT, keep the default Enable.
- SIP ALG To allow some multimedia clients to communicate across NAT, click Enable.
- RTSP ALG To allow some media player clients to communicate with some streaming media servers across NAT, click Enable.
- 3. Click Save.

8. 8. 2. Advanced Security

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Security > Advanced Security, and you can protect the router from being attacked by ICMP-Flood, UDP Flood and TCP-SYN Flood.

- DoS Protection Denial of Service protection. Select Enable or Disable to enable or disable the DoS protection function. Only when it is enabled, will the flood filters be enabled.
- Note: Dos Protection will take effect only when the Statistics in System Tool > Statistics is enabled.
- Enable ICMP-FLOOD Attack Filtering Check the box to enable or disable this function.

- ICMP-FLOOD Packets Threshold (5~3600) The default value is 50. Enter a value between 5 ~ 3600. When the number of the current ICMP-FLOOD packets is beyond the set value, the router will startup the blocking function immediately.
- Enable UDP-FLOOD Filtering Check the box to enable or disable this function.
- UDP-FLOOD Packets Threshold (5~3600) The default value is 500. Enter a value between 5 ~ 3600. When the number of the current UPD-FLOOD packets is beyond the set value, the router will startup the blocking function immediately.
- Enable TCP-SYN-FLOOD Attack Filtering -Check the box to enable or disable this function.
- TCP-SYN-FLOOD Packets Threshold (5~3600) The default value is 50. Enter a value between 5 ~ 3600. When the number of the current TCP-SYN-FLOOD packets is beyond the set value, the router will startup the blocking function immediately.
- Forbid Ping Packet From WAN Port The default setting is disabled. If enabled, the ping packet from the Internet cannot access the router.
- Forbid Ping Packet From LAN Port The default setting is disabled. If enabled, the ping packet from LAN cannot access the router. This function can be used to defend against some viruses.
- 3. Click Save.
- 4. Click Blocked DoS Host List to display the DoS host table by blocking.

8.8.3. Local Management

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- Go to Security > Local Management, and you can block computers in LAN from accessing the router.

For example, if you want to allow PCs with specific MAC addresses to access the router's web management page locally from inside the network, please follow the instructions below:

- Select Only the PCs listed can browse the built-in web pages to perform Administrator tasks.
- 2) Enter the MAC address of each PC separately. The format of the MAC address is XX:XX:XX:XX:XX:XX (X is any hexadecimal digit). Only the PCs with the listed MAC addresses can use the password to browse the built-in web pages to perform administrator tasks.
- 3) Click Set, and your PC's MAC address will also be listed.
- 4) Click Save.

Note: If your PC is blocked but you want to access the router again, press and hold the Reset button to reset the router to the factory defaults.

8. 8. 4. Remote Management

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Security > Remote Management, and you can manage your router from a remote device via the Internet.

- Web Management Port Web browser access normally uses the standard HTTP service port 80. This router's default remote management web port number is 80.
 For higher security, you can change the remote management web port to a custom port by entering a number between 1 and 65534 but do not use the number of any common service port.
- Remote Management IP Address This is the address you will use when accessing
 your router via a remote device. This function is disabled when the IP address is set
 to the default value of 0.0.0.0. To enable this function, change 0.0.0.0 to a valid IP
 address. If it is set to 255.255.255.255, then all the remote devices can access the
 router from the Internet.

Note:

- To access the router, enter your router's WAN IP address in your browser's address bar, followed by a colon and the custom port number. For example, if your router's WAN address is 202.96.12.8, and the port number used is 8080, please enter http://202.96.12.8:8080 in your browser. Later, you may be asked for the router's password. After successfully entering the username and password, you will be able to access the router's web management page.
- Be sure to change the router's default password for security purposes.

8. 9. Parental Controls

Parental Controls allows you to block inappropriate and malicious websites, and control access to specific websites at specific time for your children's devices.

For example, you want the children's PC with the MAC address 00:11:22:33:44:AA can access www.tp-link.com on Saturday only while the parent PC with the MAC address 00:11:22:33:44:BB is without any restriction.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Parental Controls.
- 3. Select Enable Parental Controls and enter the MAC address 00:11:22:33:44:BB in the MAC Address of Parental PC field. And click Save.

4. Enter appropriate parameters in corresponding fields.

- Enter 00-11-22-33-44-BB in the MAC Address -1 field.
- Select the allowed access time.
- Enter www.tp-link.com in the Add URL field and click Add.

5. Click Save.

8. 10. Access Control

Access Control is used to deny or allow specific client devices to access your network with access time and content restrictions.

I want to:

Deny or allow specific client devices to access my network with access time and content restrictions.

For example, If you want to restrict the internet activities of host with MAC address 00:11:22:33:44:AA on the LAN to access www.tp-link.com only, please follow the steps below.

How can I do that?

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Access Control > Host and configure the host settings:

- 1) Click Add New.
- Select MAC Address as the mode type. Create a unique description (e.g. host_1) for the host in the Host Description field and enter 00:11:22:33:44:AA in the MAC Address filed.

- 3) Click Save.
- 3. Go to Access Control > Target and configure the target settings:
 - 1) Click Add New.
 - 2) Select URL Address as the mode type. Create a unique description (e.g. target_1) for the target in the Target Description field and enter the URL address, either the full name or the keywords (for example TP-Link) in the Add URL Address field and click Add.
 - Note: Any domain name with keywords in it (e.g. www.tp-link.com) will be blocked or allowed.

- 3) Click Save.
- 4. Go to Access Control > Schedule and configure the schedule settings:
 - 1) Click Add New.
 - 2) Create a unique description (e.g. schedule_1) for the schedule in the Description field and set the applied time and click Add.

- 3) Click Save.
- 5. Go to Access Control > Rule and add a new access control rule.
 - 1) Click Add New.
 - 2) Give a name for the rule in the Description field. Select host_1 from the host drop-down list; select target_1 from the target drop-down list; select schedule_1 from the schedule drop-down list.

- 3) Leave the status as Enabled as click Save.
- 6. Select Enable Internet access control to enable Access Control function.
- 7. Select Deny the packets not specified by any filtering rules to passthrough this device as the default filter rules and click Save.

Done!

Now only the specific host(s) can visit the target(s) within the scheduled time period.

8. 11. Advanced Routing

Static Routing is a form of routing that is configured manually by a network administrator or a user by adding entries into a routing table. The manually-configured routing information guides the router in forwarding data packets to the specific destination.

8. 11. 1. Static Routing List

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Advanced Routing > Static Routing.
- To add static routing entries:
- 1. Click Add New.

- 2. Enter the following information.
 - Destination IP Address The Destination IP Address is the address of the network or host that you want to assign to a static route.
 - Subnet Mask The Subnet Mask determines which portion of an IP address is the network portion, and which portion is the host portion.
 - Gateway This is the IP address of the default gateway device that allows the contact between the router and the network or host.
 - Interface It is empty by default. Please select a connection from the dropdown list if the Gateway is left empty or is not on the same network segment as LAN/WAN interface.
- 3. Select Enabled or Disabled for this entry on the Status drop-down list.
- 4. Click Save.

You can also do the following operations to modify the current settings.

• Click Delete Selected to delete selected entries.

- Click Enable Selected to enable selected entries.
- Click Disable Selected to disable selected entries.

8. 11. 2. System Routing Table

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Advanced Routing > System Routing Table, and you can view all the valid route entries in use.

- Destination Network The Destination Network is the address of the network or host to which the static route is assigned.
- Subnet Mask The Subnet Mask determines which portion of an IP address is the network portion, and which portion is the host portion.
- Gateway This is the IP address of the gateway device that allows for contact between the Router and the network or host.
- Interface This interface tells you whether the Destination IP Address is on the LAN & WLAN (internal wired and wireless networks), or the WAN (Internet).
- Click Refresh to refresh the data displayed.

8. 12. Bandwidth Control

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Bandwidth Control.
- 3. Configure the bandwidth as needed and click Save.

The values you configure for the Egress Bandwidth and Ingress Bandwidth should be less than 100,000Kbps. For optimal control of the bandwidth, please select the right Line Type and consult your ISP for the total egress and ingress bandwidth.

- Enable Bandwidth Control Check this box so that the Bandwidth Control settings can take effect.
- Egress Bandwidth The upload speed through the WAN port.
- Ingress Bandwidth The download speed through the WAN port.

- Description This is the information about the rules such as address range.
- Priority Priority of Bandwidth Control rules. '1' stands for the highest priority while
 '8' stands for the lowest priority. The total Upstream/ Downstream Bandwidth is first
 allocated to guarantee all the Min Rate of Bandwidth Control rules. If there is any
 bandwidth left, it is first allocated to the rule with the highest priority, then to the rule
 with the second highest priority, and so on.
- Egress Bandwidth This field displays the max and min upload bandwidth through the WAN port. The default is 0.
- Ingress Bandwidth This field displays the max and min download bandwidth through the WAN port. The default is 0.
- Status Rule status, show whether the rule takes effect.
- Edit Choose to edit or delete an existing entry.
- To add a Bandwidth control rule:
- 1. Click Add New.
- 2. Enter the information as the figure shown below.

3. Click Save.

8. 13. IP&MAC Binding

IP & MAC Binding, namely, ARP (Address Resolution Protocol) Binding, is used to bind a network device's IP address to its MAC address. This will prevent ARP spoofing and other ARP attacks by denying network access to a device with a matching IP address in the ARP list, but with an unrecognized MAC address.

8. 13. 1. Binding Settings

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to IP & MAC Binding > Binding Settings.
- 3. Select Enable for ARP Binding.

- 4. Click Save.
- To add IP & MAC Binding entries:
- 1. Click Add New.

- 2. Enter the MAC address and IP address and select the Bind checkbox.
- 3. Click Save.
- To modify or delete an existing entry:
- 1. Find the desired entry in the table.
- 2. Click Edit or click Delete Selected.

8. 13. 2. ARP List

To manage a device, you can observe the device on the LAN by checking its MAC address and IP address on the ARP list, and you can also configure the items. This page displays the ARP list which shows all the existing IP & MAC Binding entries.

- MAC Address The MAC address of the listed computer on the LAN.
- IP Address The assigned IP address of the listed computer on the LAN.
- Status Indicates whether or not the MAC and IP addresses are bound.
- Load Selected Load selected items to the ARP list.
- Delete Selected Delete selected items.

Note: An item can not be loaded to the IP & MAC Binding list if the IP address of the item has been loaded before. Error warning will prompt as well.

8. 14. Dynamic DNS

The router offers the DDNS (Dynamic Domain Name System) feature, which allows the hosting of a website, FTP server, or e-mail server with a fixed domain name (named by yourself) and a dynamic IP address. Thus your friends can connect to your server by entering your domain name no matter what your IP address is. Before using this feature, you need to sign up for DDNS service providers such as www.comexe.cn,

www.dyndns.org, or www.noip.com. The Dynamic DNS client service provider will give you a password or key.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to Dynamic DNS.

Comexe DDNS

If the dynamic DNS Service Provider you select is www.comexe.cn, the following page will appear.

To set up for DDNS, follow these instructions:

- 1. Enter the Domain Name received from your dynamic DNS service provider.
- 2. Enter the Username for your DDNS account.
- 3. Enter the Password for your DDNS account.
- 4. Click Login.
- 5. Click Save.
- Connection Status The status of the DDNS service connection is displayed here.
- Logout Click Logout to log out of the DDNS service.

Dyndns DDNS

If the dynamic DNS Service Provider you select is www.dyn.com, the following page will appear.

To set up for DDNS, follow these instructions:

- 1. Enter the Username for your DDNS account.
- 2. Enter the Password for your DDNS account.
- 3. Enter the Domain Name you received from dynamic DNS service provider here.
- 4. Click Login.
- 5. Click Save.
- Connection Status The status of the DDNS service connection is displayed here.
- Logout Click Logout to log out of the DDNS service.

No-ip DDNS

If the dynamic DNS Service Provider you select is www.noip.com, the following page will appear.

To set up for DDNS, follow these instructions:

- 1. Enter the Username for your DDNS account.
- 2. Enter the Password for your DDNS account.
- 3. Enter the Domain Name you received from dynamic DNS service provider.
- 4. Click Login.
- 5. Click Save.
- Connection Status The status of the DDNS service connection is displayed here.
- Logout Click Logout to log out of the DDNS service.

8. 15. System Tools

8. 15. 1. Time Settings

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Time Settings and configure the system time as needed.

To set time manually:

- 1. Select your local time zone.
- 2. Enter the Date in Month/Day/Year format.
- 3. Enter the Time in Hour/Minute/Second format.
- 4. Click Save.

To set time automatically:

- 1. Select your local time zone.
- 2. Enter the address or domain of the NTP Server I or NTP Server II.
- 3. Click Get GMT to get time from the Internet if you have connected to the Internet.

To set Daylight Saving Time:

- 1. Select Enable Daylight Saving.
- 2. Select the start time from the drop-down list in the Start field.
- 3. Select the end time from the drop-down list in the End field.

4. Click Save.

Note: This setting will be used for some time-based functions such as firewall. You must specify your time zone once you log in to the router successfully; otherwise, time-based functions will not take effect.

8. 15. 2. Diagnostic

Diagnostic is used to test the connectivity between the router and the host or other network devices.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Diagnostic.

- Diagnostic Tool Select one diagnostic tool.
 - Ping This diagnostic tool troubleshoots connectivity, reachability, and name resolution to a given host or gateway.
 - Tracerouter This diagnostic tool tests the performance of a connection.
- Note: You can use ping/traceroute to test both numeric IP address or domain name. If pinging/tracerouting the IP address is successful, but pinging/tracerouting the domain name is not, you might have a name resolution problem. In this case, ensure that the domain name you are specifying can be resolved by using Domain Name System (DNS) queries.
- IP address/Domain name Enter the destination IP address (such as 192.168.0.1) or Domain name (such as www.tp-link.com).
- Pings Count The number of Ping packets for a Ping connection.
- Ping Packet Size The size of Ping packet.
- Ping Timeout Set the waiting time for the reply of each Ping packet. If there is no reply in the specified time, the connection is overtime.
- Traceroute Max TTL The max number of hops for a Traceroute connection.
- 3. Click Start to check the connectivity of the Internet.
- 4. The Diagnostic Results page displays the diagnosis result. If the result is similar to the following figure, the connectivity of the Internet is fine.

```
Diagnostic Results

Pinging 192.168.0.1 with 64 bytes of data:

Reply from 192.168.0.1: bytes=64 time=1 TTL=64 seq=1
Reply from 192.168.0.1: bytes=64 time=1 TTL=64 seq=2
Reply from 192.168.0.1: bytes=64 time=1 TTL=64 seq=3
Reply from 192.168.0.1: bytes=64 time=1 TTL=64 seq=4

Ping statistics for 192.168.0.1

Packets: Sent = 4, Received = 4, Lost = 0 (0% loss)

Approximate round trip times in milliseconds:
Minimum = 1, Maximum = 1, Average = 1
```

Note: Only one user can use this tool at one time. Options "Number of Pings", "Ping Size" and "Ping Timeout" are used for the Ping function. Option "Tracert Hops" is used for the Tracert function.

8. 15. 3. Firmware Upgrade

TP-Link is dedicated to improving and richening the product features, giving users a better network experience. We will release the latest firmware at TP-Link official website. You can download the latest firmware file from the Support page of our website www.tp-link.com and upgrade the firmware to the latest version.

- 1. Download the latest firmware file for the router from our website www.tp-link.com.
- 2. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 3. Go to System Tools > Firmware Upgrade.
- 4. Click Choose File to locate the downloaded firmware file, and click Upgrade.

8. 15. 4. Factory Defaults

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- Go to System Tools > Factory Defaults. Click Restore to reset all settings to the default values.

```

• The default Username: admin

The default Password: admin

The default IP Address: 192.168.0.1

• The default Subnet Mask: 255.255.255.0

8. 15. 5. Backup & Restore

The configuration settings are stored as a configuration file in the router. You can backup the configuration file in your computer for future use and restore the router to the previous settings from the backup file when needed.

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Backup & Restore.

To backup configuration settings:

Click Backup to save a copy of the current settings in your local computer. A ".bin" file of the current settings will be stored in your computer.

- To restore configuration settings:
- 1. Click Choose File to locate the backup configuration file stored in your computer, and click Restore.
- 2. Wait a few minutes for the restoring and rebooting.

Note: During the restoring process, do not power off or reset the router.

8. 15. 6. Reboot

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Reboot, and you can restart your router.

Some settings of the router will take effect only after rebooting, including:

- Change the LAN IP Address (system will reboot automatically).
- Change the DHCP Settings.
- Change the Web Management Port.
- Upgrade the firmware of the router (system will reboot automatically).
- Restore the router to its factory defaults (system will reboot automatically).
- Update the configuration with the file (system will reboot automatically).

8. 15. 7. Password

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Password, and you can change the factory default username and password of the router.

It is strongly recommended that you change the default username and password of the router, for all users that try to access the router's web-based utility or Quick Setup will be prompted for the router's username and password.

Note: The new username and password must not exceed 15 characters and not include any spacing.

3. Click Save.

8. 15. 8. System Log

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > System Log, and you can view the logs of the router.

- Refresh Refresh the page to show the latest log list.
- Clear Log All the logs will be deleted from the router permanently, not just from the page.
- Save Log Click to save all the logs in a txt file.
- Log Settings Click to set the logs in the screen.
 - Save Locally If Save Locally is selected, events will be recorded in the local memory.
 - Minimum Level Select the Minimum level in the drop-down list, for the Minimum Level, all logged events above or equal to the selected level will be displayed.
 - Save Remotely If Save Remotely is selected, events will be sent to the specified IP address and UDP port of the remote system log server.

8. 15. 9. Statistics

- 1. Visit http://tplinkwifi.net, and log in with the username and password you set for the router.
- 2. Go to System Tools > Statistics, and you can view the statistics of the router, including total traffic and the value of the last Packet Statistic Interval in seconds.

- Traffic Statistics Enable or Disable. The default value is disabled. To enable, click the Enable button. If disabled, the function of DoS protection in Security settings will disabled.
- Statistics Interval The default value is 10. Select a value between 5 and 60 in the drop-down list. The Packets Statistic Interval indicates the time section of the packets statistic.
- · Click Refresh to refresh immediately.
- Click Reset All to reset the values of all the entries to zero.
- Click Delete All to delete all entries in the table.

Statistics Table

| IP/MAC Address | | The IP and MAC address are displayed with related statistics. | | | |
|----------------|---------|--|--|--|--|
| Total | Packets | The total number of packets received and transmitted by the router. | | | |
| | Bytes | The total number of bytes received and transmitted by the router. | | | |
| Current | Packets | The total number of packets received and transmitted in the last Packets Statistic interval | | | |
| | | seconds. | | | |
| | Bytes | The total number of bytes received and transmitted in the last Packets Statistic interval seconds. | | | |
| | ICMP Tx | The number of the ICMP packets transmitted to WAN per second at the specified Packets | | | |
| | | Statistics interval. It is shown like "current transmitting rate / Max transmitting rate". | | | |
| | UDP Tx | The number of UDP packets transmitted to the WAN per second at the specified Packets | | | |
| | | Statistics interval. It is shown like "current transmitting rate / Max transmitting rate". | | | |
| | TCP | The number of TCP SYN packets transmitted to the WAN per second at the specified Packets | | | |
| | SYN Tx | Statistics interval. It is shown like "current transmitting rate / Max transmitting rate". | | | |
| Operation | Reset | Reset the value of the entry to zero. | | | |
| | Delete | Delete the existing entry in the table. | | | |

8. 16. Log Out

Click Logout at the bottom of the main menu, and you will log out of the web management page and return to the login window.

FAQ

Q1. What should I do if I cannot access the internet?

- If using a cable modem, unplug the Ethernet cable and reboot the modem. Wait until its Online LED is on and stable, then reconnect the Ethernet cable to the modem.
- If you're in a hotel room or on a trade show, the internet may be limited and requires that you authenticate for the service or purchase the Internet access.
- If your internet access is still not available, contact TP-Link Technical Support.

Q2. How do I restore the router to its factory default settings?

With the router powered on, press and hold the RESET button for about 5 seconds until all the LEDs start flashing and then release the button.

Note: You'll need to reconfigure the router to surf the Internet once the router is reset

Q3. What should I do if I forget my wireless password?

- If you have not changed the default Wireless Password, it can be found on the label of the router.
- Otherwise, connect a computer to the router via an Ethernet cable. Log in to the web management page, and go to Wireless 2.4GHz/5GHz > Wireless Security to retrieve or reset your wireless password.

Q4. What should I do if I forget my login password of the web management page?

The default username and password of the web management page are admin (in lowercase). If you have altered the password:

- 1. Refer to FAQ > Q2 to reset the router.
- 2. Visit http://tplinkwifi.net, and enter admin (in lowercase) as both username and password to log in.

Note: You'll need to reconfigure the router to surf the internet once the router is reset, and please mark down your new password for future use.

Q5. What should I do if my wireless signal is unstable or weak?

It may be caused by too much interference.

- Set your wireless channel to a different one.
- Choose a location with less obstacles that may block the signal between the router and the host AP. An open corridor or a spacious location is ideal.

- Move the router to a new location away from Bluetooth devices and other household electronics, such as cordless phone, microwave, and baby monitor, etc., to minimize signal interference.
- When in Range Extender mode, the ideal location to place the router is halfway between your host AP and the Wi-Fi dead zone. If that is not possible, place the router closer to your host AP to ensure stable performance.

FCC compliance information statement

Product Name: AC750 Wi-Fi Travel Router

Model Number: TL-WR902AC

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/ TV technician for help.

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions:

- 1. This device may not cause harmful interference.
- 2. This device must accept any interference received, including interference that may cause undesired operation.

Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

Note: The manufacturer is not responsible for any radio or TV interference caused by unauthorized modifications to this equipment. Such modifications could void the user's authority to operate the equipment.

FCC RF Radiation Exposure Statement

This equipment complies with FCC RF radiation exposure limits set forth for an uncontrolled environment. This device and its antenna must not be co-located or operating in conjunction with any other antenna or transmitter.

"To comply with FCC RF exposure compliance requirements, this grant is applicable to only Mobile Configurations. The antennas used for this transmitter must be installed to provide a separation distance of at least 20 cm from all persons and must not be colocated or operating in conjunction with any other antenna or transmitter."

We, TP-Link USA Corporation, has determined that the equipment shown as above has been shown to comply with the applicable technical standards, FCC part 15. There is no unauthorized change is made in the equipment and the equipment is properly maintained and operated.

CE Mark Warning

This is a class B product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

OPERATING FREQUENCY(the maximum transmitted power)

2400 MHz -2483.5 MHz(20dBm)

5150 MHz -5250 MHz(23dBm)

EU declaration of conformity

TP-Link hereby declares that the device is in compliance with the essential requirements and other relevant provisions of directives 2014/53/EU, 2009/125/EC, 2011/65/EU and (EU) 2015/863.

The original EU declaration of conformity may be found at

https://www.tp-link.com/en/support/ce/

RF Exposure Information

This device meets the EU requirements (2014/53/EU Article 3.1a) on the limitation of exposure of the general public to electromagnetic fields by way of health protection.

The device complies with RF specifications when the device used at 20 cm from your body.

National Restrictions

Attention: This device may only be used indoors in all EU member states, EFTA countries and Northern Ireland.

Frequency band: 5150 - 5250 MHz:

Indoor use: Inside buildings only. Installations and use inside road vehicles and train carriages are not permitted. Limited outdoor use: If used outdoors, equipment shall not be attached to a fixed installation or to the external body of road vehicles, a fixed infrastructure or a fixed outdoor antenna. Use by unmanned aircraft systems (UAS) is limited to within the 5170 - 5250 MHz band.

Frequency band: 5250 - 5350 MHz:

Indoor use: Inside buildings only. Installations and use in road vehicles, trains and aircraft are not permitted. Outdoor use is not permitted.

Frequency band: 5470 - 5725 MHz:

Installations and use in road vehicles, trains and aircraft and use for unmanned aircraft systems (UAS) are not permitted.

UKCA Mark

UK Declaration of Conformity

TP-Link hereby declares that the device is in compliance with the essential requirements and other relevant provisions of the Radio Equipment Regulations 2017.

The original UK Declaration of Conformity may be found at https://www.tp-link.com/support/ukca

National Restrictions

Attention: This device may only be used indoors in Great Britain.

Canadian Compliance Statement

This device contains licence-exempt transmitter(s)/receiver(s) that comply with Innovation, Science and Economic Development Canada's licence-exempt RSS(s). Operation is subject to the following two conditions:

- (1) This device may not cause interference.
- (2) This device must accept any interference, including interference that may cause undesired operation of the device.

L'émetteur/récepteur exempt de licence contenu dans le présent appareil est conforme aux CNR d'Innovation, Sciences et Développement économique Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes :

- 1) L'appareil ne doit pas produire de brouillage;
- 2) L'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

Caution:

The device for operation in the band 5150–5250 MHz is only for indoor use to reduce the potential for harmful interference to co-channel mobile satellite systems;

Avertissement:

Le dispositif fonctionnant dans la bande 5150-5250 MHz est réservé uniquement pour une utilisation à l'intérieur afin de réduire les risques de brouillage préjudiciable aux systèmes de satellites mobiles utilisant les mêmes canaux;

Radiation Exposure Statement:

This equipment complies with IC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

Déclaration d'exposition aux radiations:

Cet équipement est conforme aux limites d'exposition aux rayonnements IC établies pour un environnement non contrôlé. Cet équipement doit être installé et utilisé avec un minimum de 20 cm de distance entre la source de rayonnement et votre corps.

Industry Canada Statement

CAN ICES-3 (B)/NMB-3(B)

Korea Warning Statements:

당해 무선설비는 운용중 전파혼신 가능성이 있음.

NCC Notice & BSMI Notice:

注意!

取得審驗證明之低功率射頻器材,非經核准,公司、商號或使用者均不得擅自變更頻率、加大功率或變更原設計之特性及功能。

低功率射頻器材之使用不得影響飛航安全及干擾合法通信;經發現有干擾現象時,應立即停用,並改善至無干擾時方得繼續使用。

前述合法通信,指依電信管理法規定作業之無線電通信。

低功率射頻器材須忍受合法通信或工業、科學及醫療用電波輻射性電機設備之干擾。

應避免影響附近雷達系統之操作。

高增益指向性天線只得應用於固定式點對點系統。

安全諮詢及注意事項

- 請使用原裝電源供應器或只能按照本產品注明的電源類型使用本產品。
- 清潔本產品之前請先拔掉電源線。請勿使用液體、噴霧清潔劑或濕布進行清潔。
- 注意防潮,請勿將水或其他液體潑灑到本產品上。

- 插槽與開口供通風使用,以確保本產品的操作可靠並防止過熱,請勿堵塞或覆蓋 開口。
- 請勿將本產品置放於靠近熱源的地方。除非有正常的通風,否則不可放在密閉位置中。
- 請不要私自打開機殼,不要嘗試自行維修本產品,請由授權的專業人士進行此項工作

限用物質含有情況標示聲明書

設備名稱:AC750 Wi-Fi Travel Router 型號(型式):TL-WR902AC Equipment name Type designation (Type)

| Type designation (Type) | | | | | | |

Safety Information

• Keep the device away from water, fire, humidity or hot environments.

- Do not attempt to disassemble, repair, or modify the device. If you need service, please contact us.
- Do not use damaged charger or USB cable to charge the device.
- Do not use any other chargers than those recommended
- Do not use the device where wireless devices are not allowed.
- Adapter shall be installed near the equipment and shall be easily accessible.
- Use only power supplies which are provided by manufacturer and in the original packing of this product. If you have any questions, please don't hesitate to contact us.
- Operating Temperature: 0°C ~ 40°C (32°F ~ 104°F)
- This product uses radios and other components that emit electromagnetic fields. Electromagnetic fields and magnets may interfere with pacemakers and other implanted medical devices. Always keep the product and its power adapter more than 15 cm (6 inches) away from any pacemakers or other implanted medical devices. If you suspect your product is interfering with your pacemaker or any other implanted medical device, turn off your product and consult your physician for information specific to your medical device.

Please read and follow the above safety information when operating the device. We cannot guarantee that no accidents or damage will occur due to improper use of the device. Please use this product with care and operate at your own risk.

Explanations of the symbols on the product label

The product label is at the back of the router.

| Symbol | Explanation |
|-------------|------------------------------|
| === | DC voltage |
| \sim | AC voltage |
| | Class II equipment |
| ♦- • | Polarity of output terminals |
| (VI) | Energy efficiency Marking |
| | Indoor use only |
| <u> </u> | Caution |
| 0 | Operator's manual |

Symbol Explanation

This product bears the selective sorting symbol for Waste electrical and electronic equipment (WEEE). This means that this product must be handled pursuant to European directive 2012/19/EU in order to be recycled or dismantled to minimize its impact on the environment.

User has the choice to give his product to a competent recycling organization or to the retailer when he buys a new electrical or electronic equipment.
