

FCC TEST REPORT No. 14/986	2014
for 47 CFR Part 15	November, 27

Model name:

LCU NEMA PRO

Product description

Street light controller

FCC ID

NTAT210

Applicant

Telematics Wireless Ltd., Israel

Manufacturer

Telematics Wireless Ltd., Israel

The results in this report apply only to the samples tested.

1 EQUIPMENT UNDER TEST

1.1 Basic description

Equipment Category	
Model name	LCU NEMA PRO
Destination	a compact RF Transceiver unit for street light control system
Configuration	stand-alone device
ID number	n/a

1.2 Technical characteristics declared by manufacturer

Table 1.2.1 – FHSS Narrow Channel Parameters	
Parameter	Value
Frequency Band	902 – 928 MHz
Modulation	Frequency Shift Keying (2GFSK)
Receiver Sensitivity	-105 dBm@110 kbps (BER < 0.1%)
Channel Separation	400 kHz
Data Rates	110 kbps
Frequency deviation	± 50 kHz
Channel Bandwidth @ 20dBc	<250 kHz
Frequency stability (including initial stability, temperature and aging)	<12 ppm
Peak Output power (without Antenna)	Up to +27dBm
Number of hopping channels	51 channels, from 904.8 MHz to 924.8 MHz at 0.4 MHz steps
Harmonics	< - 54 dBm
Max Occupancy time on any channel	400 ms per 20 seconds

Table 1.2.2 – FHSS Wide Channel Parameters	
Parameter	Value
Frequency Band	902 – 928 MHz
Modulation	Frequency Shift Keying (2GFSK)
Receiver Sensitivity	-105 dBm@110 kbps (BER < 0.1%)
Channel Separation	800 kHz
Data Rates	220 kbps
Frequency deviation	±110 kHz
Channel Bandwidth @ 20dBc	≥250 kHz
Frequency stability (including initial stability, temperature and aging)	<12 ppm
Peak Output power (without Antenna)	Up to +24 dBm
Number of hopping channels	26 channels, from 904.8 MHz to 924.8 MHz at 0.8 MHz steps
Harmonics	< - 54 dBm
Max Occupancy time on any channel	400 ms per 10 seconds

Antenna

2 GENERAL INFORMATION ABOUT TESTS

2.1 Test program and results of the tests

Number of test	FCC rule	Description of test	Result (Pass, Fail, N/A)
1	15.247(b)3	Peak Output Power	Pass
2	15.207(a)	Conducted Emissions	Pass
3	15.107(a)	Conducted Emissions	Pass
4	15.247(d)	Radiated Spurious Emissions	Pass
5	15.109 Class B	Radiated Emission	Pass

Tested by:

tests No. 1: Laboratory engineer

Checked by:

Leading engineer

tests No. 2 - 5: Laboratory engineer

Boris Trifonov

Fjodor Shubin

Vladimir Osaulko

2.2 Test conditions and test modes

Normal temperature and humidity:

- temperature: from +15 °C to +35 °C;

- relative humidity: from 20 % to 75 %

Normal power source:

- Unom = 120 VAC

The frequencies for the testing

Channel	Frequency, MHz
Low	904.8
Mid	914.4
High	924.8

2.3 Test equipment used

№	Name	Model	Inventory or serial No.
1.	EMI Test receiver/spectrum analyzer	R&S ESU-26	100260
2.	Spectrum analyzer	R&S FSV40	105763
3.	Signal Generator	SMB100A	100217
4.	Antenna (30 – 1000) MHz	Schwarzbeck UBAA 9114	9111-214
5.	Antenna (30 – 1000) MHz	Schwarzbeck VULB9163	9163244
6.	Antenna (1000 - 10000) MHz	HP11966 model 3115	9903-5701
7.	Antenna (750 - 10000) MHz	ETS-Lindgren model 3115	154877
8.	Loop antenna	APA-CP	101142
9.	Digital multimeter	FLUKE 189	89750179
10.	Preamplifier (0.1-18) GHz	Agilent 87405c	MY47010400
11.	Psychrometer	BIT-2	B931
12.	Shielded Semi-Anechoic Chamber	"DON"	1

All listed above test equipment is calibrated and certified in accordance with established procedure. The equipment has certificates currently in force.

Ancillary equipment

№	Name	Model
1.	Test load	TNET 200 DEBUG ADAPTER
2.	Notebook	IBM ThinkPad

2.4 Measurement uncertainty

Parameter	Maximum uncertainty
Radiated emission	± 5.2 dB
Conducted emission	± 2.7 dB
Frequency	$\pm 1 \times 10^{-8}$
Temperature	± 1 °C
Humidity	± 2 %
Voltage supply DC	± 2 %

This uncertainty represents an expanded uncertainty expressed at approximately the 95 % confidence level using a coverage factor of $k = 2$.

2.5 Photo of test site**Figure 2.5.1 Radiated measurements****Figure 2.5.2 Radiated measurements**

Figure 2.5.3 Conducted measurments

3 REPORT OF MEASUREMENTS AND EXAMINATIONS

3.1 Peak Output power

3.1.1 Test requirements 15.247 (b) 3

b) The maximum peak conducted output power of the intentional radiator shall not exceed the following:

3) For systems using digital modulation in the (902 - 928) MHz, (2400 - 2483.5) MHz, and (5725 - 5850) MHz bands: 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power. Maximum Conducted Output Power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power level. If multiple modes of operation are possible (e.g., alternative modulation methods), the maximum conducted output power is the highest total transmit power occurring in any mode.

(4) The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b) (1), (b) (2), and (b) (3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

3.1.2 Test procedure

1) The transmitter output was connected to the spectrum analyzer through the test load.

2) The transmitter was set to the normal operational mode with the maximum power rating.

3) Spectrum analyzer was set to the hopping frequency investigated in Time Domain Power Measurement mode with the following settings: RBW = Channel Separation; VBW > RBW; Video Detector = RMS; Trigger = Video; Span = Zero Span; Sweep Time = Adjusted to observe the whole burst.

4) The power was measured as average power during the burst in Time Domain Power Measurement mode.

3.1.3 Test setup layout

Test setup layout

3.1.4 Test result

Temperature: +18 °C

Relative humidity: 40 %

Table 3.1.1 Peak output power test result

Frequency, MHz	Output generator, dBm	Coax Loss, dB	Antenna gain, dBi	Test antenna height, m	Measured E.I.R.P., dBm	E.I.R.P Limit, dBm	Test Result (Pass, Fail, N/A)
FHSS Narrow Channel Mode							
904.8	20.35	- 3.5	6.0	1.05	22.85	30	Pass
914.4	23.90	- 3.8	6.0	1.05	26.10	30	Pass
924.8	23.60	- 4.8	6.0	1.05	24.80	30	Pass
FHSS Wide Channel Mode							
904.8	19.90	- 3.5	6.0	1.05	22.40	30	Pass
914.4	23.55	- 3.8	6.0	1.05	25.75	30	Pass
924.8	23.25	- 4.8	6.0	1.05	24.45	30	Pass

3.2 Conducted Emissions

3.2.1 Test requirements of 15.207

(a) Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table, as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Frequency of emission (MHz)	Conducted limit (dB μ V)	
	Quasi-peak	Average
0.15-0.5	66 to 56*	56 to 46*
0.5-5	56	46
5-30	60	50

*Decreases with the logarithm of the frequency.

3.2.2 Test procedure (ANSI C63.10-2013, Sections 6.3)

The EUT emitted a BEACON (Info + Reading value + Alarm Status) every 11sec.

The EUT was placed on a platform of nominal size 1 m by 1.5 m, raised 80 cm above the reference ground plane. The vertical conducting plane or wall of an RF-shielded (screened) room shall be located 40 cm to the rear of the EUT. All other surfaces of tabletop or floor-standing EUTs shall be at least 80 cm from any other grounded conducting surface, including the case or cases of one or more LISNs.

The measurements were performed on the line under test in a 2m x 2m x 2m screened enclosure by means of an Impedance Stabilization Network (ISN) bonded to the ground plane and connected to the spectrum analyzer. The EUT was placed on a non-metallic table, 0.8m above the ground reference plane and was configured, arranged and operated in a manner consistent with typical application and load conditions. Normal performance of the EUT was verified.

Conducted common mode (asymmetric mode) disturbance at the tested port was investigated in the appropriate frequency range using the resolution-bandwidth per CISPR16-1, Table 7, and QP and Average readings were taken.

Worst-case results were recorded.

3.2.3 Test result

Temperature: +20°C

Relative humidity: 63%

EUT OPERATING MODE: Transmit

Table 3.2.1 Conducted emission test result**“Phase” (904.8 MHz, 110 kbps, QP detector)**

Frequency, MHz	Measured Result, dBμV	Limit, dBμV	Margin, dB	Result (Pass, Fail, N/A)

3.3 Conducted Emissions

3.3.1 Test requirements of 15.107

(a) Except for Class A digital devices, for equipment that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits in the following table, as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the band edges.

Frequency of emission (MHz)	Conducted limit (dB μ V)	
	Quasi-peak	Average
0.15-0.5	66 to 56*	56 to 46*
0.5-5	56	46
5-30	60	50

*Decreases with the logarithm of the frequency.

3.3.2 Test procedure (ANSI C63.10-2013, Sections 6.3)

The EUT was placed on a platform of nominal size 1 m by 1.5 m, raised 80 cm above the reference ground plane. The vertical conducting plane or wall of an RF-shielded (screened) room shall be located 40 cm to the rear of the EUT. All other surfaces of tabletop or floor-standing EUTs shall be at least 80 cm from any other grounded conducting surface, including the case or cases of one or more LISNs.

The measurements were performed on the line under test in a 2m x 2m x 2m screened enclosure by means of an Impedance Stabilization Network (ISN) bonded to the ground plane and connected to the spectrum analyzer. The EUT was placed on a non-metallic table, 0.8m above the ground reference plane and was configured, arranged and operated in a manner consistent with typical application and load conditions. Normal performance of the EUT was verified.

Conducted common mode (asymmetric mode) disturbance at the tested port was investigated in the appropriate frequency range using the resolution-bandwidth per CISPR16-1, Table 7, and QP and Average readings were taken.

Worst-case results were recorded.

3.3.3 Test result

Temperature: +20°C

Relative humidity: 63%

EUT OPERATING MODE: Idle

3.4 Spurious Emissions (radiated)

3.4.1 Test requirements 15.247 (d)

(d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least **20 dB** below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b) (3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in § 15.209 (a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in § 15.205 (a), must also comply with the radiated emission limits specified in § 15.209 (a) (see § 15.205 (c)).

Table 3.4.1 Radiated spurious emissions limits

Frequency, MHz	Field strength at 3 m within restricted bands, dB(μV/m) ^{***}			Attenuation of field strength of spurious versus carrier outside restricted bands, dBc ^{***}
	Peak	Quasi Peak	Average	
0.009 – 0.090	148.5 – 128.5	NA	128.5 – 108.5 ^{**}	20.0
0.090 – 0.110	NA	108.5 – 106.8 ^{**}	NA	
0.110 – 0.490	126.8 – 113.8	NA	106.8 – 93.8 ^{**}	
0.490 – 1.705	NA	73.8 – 63.0 ^{**}	NA	
1.705 – 30.0*		69.5		
30 – 88		40.0		
88 – 216		43.5		
216 – 960		46.0		
960 - 1000		54.0		
1000 – 10 th harmonic	74.0	NA	54.0	

* - The limit for 3 m test distance was calculated using inverse square distance extrapolation factor as follows:

$$\text{Lim}_{s_2} = \text{Lim}_{s_1} + 40\log(S_1/S_2),$$

where S_1 and S_2 – standard defined and test distance respectively in meters.

** - The limit decreases linearly with the logarithm of frequency.

*** - The field strength limits applied from lower radio frequency generated in the device, without going below 9 kHz up to the tenth harmonic of the highest fundamental frequency.

3.4.2 Test procedure (Public Notice DA 00-705; ANSI C63.4)

The transmitter was set to the normal operational mode with the maximum power rating.

Measurements of spurious emissions outside restricted bands.

Measurement were made in the anechoic chamber with metal floor (in the band of 9 kHz - 1000 MHz) and in fully anechoic chamber (1000 MHz - 10000 MHz) at distance of 3 m. The turntable was rotated, test antenna height (in the band 30 MHz-1000 MHz) was altered in the range of 1-4m (in the chamber with metal floor), test antenna polarization was changed from horizontal to vertical to find maximum reading. In the frequency range of 9 kHz to 30 MHz measurements were made with loop antenna placed at the height of 1 m.

1) Reference power was measured on the center frequency of the signal at distance of 3 m using biconical antenna by the test receiver with the following settings: RBW = 100 kHz, VBW = 300 kHz, Video Detector = Positive Peak.

Spurious emissions were measured:

- 2) In the band of 9 kHz - 30 MHz with active loop antenna and with the following test receiver settings: RBW = 100 kHz; VBW = 300 kHz; Video Detector = Positive Peak.
- 3) In the band of 30 MHz - 1000 MHz with biconical antenna and with the following test receiver settings: RBW = 100 kHz; VBW = 300 kHz; Video Detector = Positive Peak.
- 4) In the band of 1000 MHz - 10000 MHz with horn antenna and with the following test receiver settings: RBW = 100 kHz; VBW = 300 kHz; Video Detector = Positive Peak.
- 5) The worst test results (the lowest margins) were recorded and shown in the associated plots.

Measurements of spurious emissions within restricted bands below 1 GHz.

Measurement were made in the anechoic chamber with metal ground floor at distance of 3 m. The turntable was rotated, test antenna height (above 30 MHz) was altered in the range of 1-4m, test antenna polarization was changed from horizontal to vertical to find maximum reading.

Spurious emissions were measured:

- 1) In the band of 9 kHz - 150 kHz with active loop antenna and with the following settings of test receiver: RBW = 1 kHz; VBW = 3 kHz; Video Detector = Positive Peak - during prequalification measurement, Quasi-Peak - during final measurement.
- 2) In the band of 150 kHz - 30 MHz with active loop antenna and with the following settings of test receiver: RBW = 10 kHz; VBW = 30 kHz, Video Detector = Positive Peak - during prequalification measurement, Quasi-Peak - during final measurement.
- 3) In the band of 30 MHz - 1000 MHz with biconical antenna and with the following settings of test receiver: RBW = 120 kHz, VBW = 300 kHz, Video Detector = Positive Peak - during prequalification measurement, Quasi-Peak - during final measurement.
- 4) The worst test results (the lowest margins) were recorded and shown in the associated plots.

Measurements of spurious emissions within restricted bands above 1 GHz.

Measurements were made in the anechoic chamber at distance of 3 m. The turntable was rotated; test antenna polarization was changed from horizontal to vertical to find maximum reading.

Spurious emissions were measured:

- 1) In the band of 1000 MHz - 10000 MHz with horn antenna and with the following settings of test receiver: RBW = 1 MHz, VBW = 3 MHz, Video Detector = Positive Peak - during prequalification measurement, Average - during final measurement.
- 2) The worst test results (the lowest margins) were recorded and shown in the associated plots.

3.5 Radiated Emission

3.5.1 Test requirements 15.109 Class B

Frequency of emission (MHz)	Field strength (microvolts/meter)	Field Strength (dB μ V/m)
30-88	100	40
88-216	150	43.5
216-960	200	46
Above 960	500	54

3.5.2 Test procedure (ANSI C63.4, Sections 11.6 and 12.1.4)

The test was performed to measure radiated emissions from the equipment under test enclosure. The measurement was made in the anechoic chamber at measurement distance of 3m in two bands: (30-1000) MHz, (1000-10000) MHz.

- 1) The equipment under test was set to stand-by mode.
- 2) In the band of (30-1000) MHz the measurement was made in anechoic chamber with metal floor. The turntable was rotated, the antenna height was altered in the range of 1m - 4m, the polarization of biconical antenna was changed from horizontal to vertical in a process of seeking for the maximum result. Settings of the test receiver: RBW = 120 kHz; Video Detector = Positive Peak during prequalification measurement, Quasi-Peak - during final measurement.
- 3) In the band of (1000-10000) MHz the measurement was made in fully anechoic chamber. The height of test antenna was fixed while the turntable was rotated and the polarization of horn test antenna was changed from horizontal to vertical in a process of seeking for the maximum result. Settings of the test receiver: RBW = 1000 kHz; Video Detector = Positive Peak during prequalification measurement, Average - during final measurement.
- 4) The worst test results (the lowest margins) were recorded and shown in the associated plots.
