

Identification system for Coin magazines:

The primary function of the equipment is to check the contents of a money box or change holder and determine its contents. If the box is full or empty, a transponder, upon being queried will transmit a signal to advise the attendant that corrective action is needed. There are three types of coin magazines; coin hopper, coin vault and coin cassette.

Additional circuitry has been added that permits an attendant to query the various coin magazines in order to determine the level of coins remaining in those magazines. The additional circuitry operates at the same nominal frequency as the coin magazine transponders. Each circuit has a unique ID code assigned to it for purposes of identifying the measured parameter.
