Wireless AC1200 4G LTE Router

Package Contents

DWR-961 Wireless AC1200 4G LTE Router

Power Adapter

4G Antennas

RJ-45 Cable

If any of the above items are missing, please contact your reseller.

System Requirements

- A compatible SIM/UICC card with service.*
- Computer with Windows 10/8/7/Vista/XP, Mac OS 10.3 or above, or Linux-based operating system with a compatible network adapter.
- Java-enabled browser such as Internet Explorer 9, Safari 7, Chrome 28, or Firefox 23 or above (for configuration).

* Subject to services and service terms available from your carrier.

Introduction

D-Link's DWR-961 4G LTE Router allows you to access mobile broadband networks from anywhere. Once connected, you can check e-mail, surf the web, and stream media. Use your carrier's SIM/UICC card to share your 4G Internet connection through a secure wireless network or by using any of the four 10/100 Ethernet ports.

The DWR-961 lets you connect to your 4G mobile connection with fast downlink speeds of up to 100 Mbps and uplink speeds up to 50 Mbps, giving you the speed to ensure fast, responsive Internet access. Surf the web with ease and stream music and video over the Internet to your PCs and mobile devices.

The DWR-961 utilizes dual-active firewalls (SPI and NAT) to prevent potential attacks across the Internet. Industry standard WPA/WPA2 wireless encryption keeps your wireless network secure and your traffic safe, allowing you to share your 4G connection without worrying about unauthorized users accessing your network.

The DWR-961 can be installed quickly and easily almost anywhere. It can be configured through almost any web browser without the need for special software. This router makes it possible to stay connected, even when conventional broadband services are unavailable.

Wireless Installation Considerations

The DWR-961 can be accessed using a wireless connection from anywhere within the operating range of your wireless network. Keep in mind that the quantity, thickness, and location of walls, ceilings, or other objects that the wireless signals must pass through may limit the range of the wireless signal. Ranges vary depending on the types of materials and background RF (radio frequency) noise in your home or office. The key to maximizing the wireless range is to follow these basic guidelines:

1. Minimize the number of walls and ceilings between the D-Link router and other network devices. Each wall or ceiling can reduce your adapter's range from 3 to 90 feet (1 to 30 meters).
2. Be aware of the direct line between network devices. A wall that is 1.5 feet thick (0.5 meters), at a 45-degree angle appears to be almost 3 feet (1 meter) thick. At a 2-degree angle it looks over 42 feet (14 meters) thick. Position devices so that the signal will travel straight through a wall or ceiling (instead of at an angle) for better reception.
3. Try to position access points, wireless routers, and computers so that the signal passes through open doorways and drywall. Materials such as glass, metal, brick, insulation, concrete, and water can affect wireless performance. Large objects such as fish tanks, mirrors, file cabinets, metal doors, and aluminum studs may also have a negative effect on range.
4. If you are using 2.4 GHz cordless phones, make sure that the 2.4 GHz phone base is as far away from your wireless device as possible. The base transmits a signal even if the phone is not in use. In some cases, cordless phones, X-10 wireless devices, and electronic equipment such as ceiling fans, fluorescent lights, and home security systems may dramatically degrade wireless connectivity.

Configuration

Getting Started

To access the configuration utility, open a web browser such as Internet Explorer and enter the address of the router (**192.168.0.1** by default).

To log in to the configuration utility, **admin** is the default username and the default password is left blank.

Note: If you get a **Page Cannot be Displayed** error, please refer to the **Troubleshooting** section for assistance.

Once you have successfully logged in, you will see the **Home** page. On this page you can view information about your Internet connection, the wireless/LAN status, and system information.

At the top of the page is a menu. Clicking on one of these icons will take you to the appropriate configuration section.

Internet WAN Service

On this page you can configure your Internet connection. If you are not sure which settings to use, please contact your Internet Service Provider (ISP).

My Internet Connection is: Select the Internet connection type specified by your ISP. The corresponding settings will be displayed below. Please see the following sections for details on how to configure these different connection types.

Dynamic IP (DHCP)

Host Name: If your ISP requires you to enter a host name, enter it here. In most cases, you may leave this blank.

Primary DNS Server: (Optional) Fill in with IP address of primary DNS server.

Secondary DNS Server: (Optional) Fill in with IP address of secondary DNS server.

MTU: You may need to change the Maximum Transmission Unit (MTU) for optimal performance. The default value is 0.

MAC Address: The default MAC address is set to the WAN port's physical interface MAC address on the router. It is not recommended that you change the default MAC address unless required by your ISP. You can use the **Clone** button to replace the WAN port's MAC address with the MAC address of your PC.

The screenshot shows the D-Link router's WAN Service Configuration page. The 'Internet Connection Type' is set to 'Dynamic IP (DHCP)'. The 'Dynamic IP (DHCP) Internet Connection Type' section contains the following fields and options:

- Host Name: [Empty text box]
- Primary DNS Server: [Empty text box]
- Secondary DNS Server: [Empty text box]
- MTU: [0] (bytes)
- MAC Address: [Empty text box] with a 'Clone' button next to it.
- Reconnect Mode: ☒ Enable
- NAT disable: ☐ Enable

At the bottom of the configuration section are 'Apply' and 'Refresh' buttons.

Reconnect Mode: This feature enables this product to renew the WAN IP address automatically when the lease time has expired.

NAT disable: Enabling this option will disable the NAT firewall function of the DWR-961, exposing all connected devices directly to the Internet. This is an advanced feature and not recommended for normal use.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link DWR-961 web interface. The top navigation bar includes the D-Link logo and icons for Home, Internet, Wi-Fi, LAN, Advanced, and System. The main content area is titled "WAN Service Configuration". On the left, a sidebar lists "WAN Service" with sub-options: Wizard, Multi-WAN, and IPv6. The main configuration area is for "Internet Connection Type". It shows "My Internet Connection is" set to "Dynamic IP (DHCP)". Below this, the "Dynamic IP (DHCP) Internet Connection Type" section contains fields for Host Name, Primary DNS Server, Secondary DNS Server, MTU (set to 1500 bytes), and MAC Address. There is a "Clone" button next to the MAC Address field. At the bottom of this section, there are checkboxes for "Reconnect Mode" (checked/Enabled) and "NAT disable" (unchecked/Disabled). At the very bottom of the page, there are "Apply" and "Refresh" buttons. A small copyright notice "Copyright © 2012. All Rights Reserved" is visible at the bottom right.

Static IP

IP Address: Enter the IP address assigned to your network connection.

Subnet Mask: Enter the subnet mask.

Default Gateway: Enter the default gateway.

Primary DNS Server: Enter the primary DNS server.

Secondary DNS Server: Enter the secondary DNS server.

MTU: You may need to change the Maximum Transmission Unit (MTU) for optimal performance. The default value is 0.

MAC Address: The default MAC address is set to the WAN port's physical interface MAC address on the router. It is not recommended that you change the default MAC address unless required by your ISP. You can use the **Clone** button to replace the WAN port's MAC address with the MAC address of your PC.

NAT disable: Enabling this option will disable the NAT firewall function of the DWR-961, exposing all connected devices directly to the Internet. This is an advanced feature and not recommended for normal use.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link router's web interface. The top navigation bar includes the D-Link logo and icons for Home, Internet, Wi-Fi, LAN, Advanced, and System. The main content area is titled 'WAN Service Configuration'. On the left, a sidebar lists 'WAN Service' with sub-options: Wizard, Multi-WAN, and IPv6. The 'Internet Connection Type' is set to 'Static IP'. Below this, the 'Static IP Address Internet Connection Type' section contains input fields for IP Address, Subnet Mask, Default Gateway, Primary DNS Server, Secondary DNS Server, and MTU (with a 'bytes' label). There is a 'Clone' button next to the MAC Address field. At the bottom, there are 'Apply' and 'Refresh' buttons. The 'NAT disable' checkbox is also visible.

PPPoE (Username / Password)

Username: The username provided by your ISP for your PPPoE account.

Password: Password provided by your ISP for your PPPoE account.

Verify Password: Re-type your password in this field.

Service Name: Fill in if provided by your ISP. (Optional)

IP Address: Fill in if provided by your ISP. If not, keep the default value.

Primary DNS Server: Fill in if provided by your ISP. If not, keep the default value (optional).

Secondary DNS Server: Fill in if provided by your ISP. If not, keep the default value (optional).

MAC Address: The default MAC address is set to the WAN port's physical interface MAC address on the router. It is not recommended that you change the default MAC address unless required by your ISP. You can use the **Clone** button to replace the WAN port's MAC address with the MAC address of your PC.

Maximum Idle Time: The amount of time of inactivity before disconnecting an established PPPoE session. Set it to zero or enable auto-reconnect to disable this feature.

MTU: You may need to change the Maximum Transmission Unit (MTU) for optimal performance. The default value is 0.

Reconnect Mode: Choose **Always-on** when you want to establish PPTP connection all the time. If you choose **Connect-on-demand**, the device will establish a PPTP connection when local users want to connect to the Internet, and disconnect if there is no traffic after the time period defined by the **Maximum Idle Time** setting.

The screenshot shows the D-Link router's web interface. The top navigation bar includes links for Home, Internet, Wi-Fi, LAN, Advanced, and System. The left sidebar shows 'WAN Service' with sub-options: Wizard, Multi-WAN, and IPv6. The main content area is titled 'WAN Service Configuration'. Under 'Internet Connection Type', 'My Internet Connection is' is set to 'PPPoE (Username / Password)'. The 'PPPoE' section contains input fields for Username, Password, Verify Password, Service Name (optional), IP Address, Primary DNS Server (optional), Secondary DNS Server (optional), and MAC Address. A 'Clone' button is next to the MAC Address field. Below these fields, 'Reconnect Mode' has three radio buttons: 'Always-on' (selected), 'Connect-on-demand', and 'Manual'. 'Maximum Idle Time' is set to '300 seconds'. 'MTU' is set to '0 (bytes)'. There is a checkbox for 'NAT disable' which is currently unchecked. At the bottom of the form are 'Apply' and 'Refresh' buttons.

NAT disable: Enabling this option will disable the NAT firewall function of the DWR-961, exposing all connected devices directly to the Internet. This is an advanced feature and not recommended for normal use.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link WAN Service Configuration page. The top navigation bar includes the D-Link logo and icons for Home, Internet, Wi-Fi, LAN, Advanced, and System. The main content area is titled 'WAN Service Configuration' and includes a sidebar with 'WAN Service' and its sub-items: Wizard, Multi-WAN, and IPv6. The main configuration area is divided into sections: 'Internet Connection Type' with a dropdown menu set to 'PPPoE (Username / Password)', 'PPPoE' with fields for Username, Password, Verify Password, Service Name (optional), IP Address, Primary DNS Server (optional), Secondary DNS Server (optional), and MAC Address (with a Clone button), 'Reconnect Mode' with radio buttons for Always on (selected), Connect on demand, and Manual, 'Maximum Idle Time' with a spinner set to 300 seconds, 'MTU' with a spinner set to 0 bytes, and 'NAT disable' with an unchecked checkbox labeled 'Enable'. At the bottom are 'Apply' and 'Refresh' buttons.

PPTP

Address Mode: Choose **Static IP** only if your ISP provides you with a static IP address for PPTP. Otherwise, please choose **Dynamic IP**.

PPTP IP Address: Enter the information provided by your ISP (Only applicable for Static IP PPTP).

PPTP Subnet Mask: Enter the information provided by your ISP (Only applicable for Static IP PPTP).

PPTP Gateway IP Address: Enter the information provided by your ISP (Only applicable for Static IP PPTP).

PPTP Server IP Address: IP address of the PPTP server.

Username: User/account name that your ISP provides to you for PPTP dial-up.

Password: Password that your ISP provides to you for PPTP dial-up.

Verify Password: Re-enter your password for verification.

Reconnect Mode: Choose **Always-on** when you want to establish PPTP connection all the time. If you choose **Connect-on-demand**, the device will establish a PPTP connection when local users want to connect to the Internet, and disconnect if there is no traffic after the time period defined by the **Maximum Idle Time** setting.

Maximum Idle Time: The time of no activity to disconnect your PPTP session. Set it to zero or choose **Always-on** to disable this feature.

The screenshot shows the D-Link WAN Service Configuration page. The 'Internet Connection Type' is set to 'PPTP (Username / Password)'. Under the 'PPTP' section, the 'Address Mode' is set to 'Dynamic IP'. The 'PPTP IP Address', 'PPTP Subnet Mask', 'PPTP Gateway IP Address', and 'PPTP Server IP Address' fields are empty. The 'Username' and 'Password' fields are also empty. The 'Verify Password' field is empty. The 'Reconnect Mode' is set to 'Always-on'. The 'Maximum Idle Time' is set to '000 seconds'. The 'NAT disable' checkbox is unchecked. The 'Apply' and 'Refresh' buttons are at the bottom.

NAT disable: Enabling this option will disable the NAT firewall function of the DWR-961, exposing all connected devices directly to the Internet. This is an advanced feature and not recommended for normal use.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link DWR-961 web interface. At the top, there is a navigation bar with icons for Home, Internet, Wi-Fi, LAN, Advanced, and System. The 'Internet' icon is selected. Below the navigation bar, the 'WAN Service' menu is expanded, showing options for Wizard, Multi-WAN, and IPv6. The main content area is titled 'WAN Service Configuration'. Under 'Internet Connection Type', 'My Internet Connection is' is set to 'PPTP (Username / Password)'. The 'PPTP' section contains the following fields: Address Mode (Dynamic IP selected, Static IP unselected), PPTP IP Address, PPTP Subnet Mask, PPTP Gateway IP Address, PPTP Server IP Address, Username, Password, and Verify Password. The 'Reconnect Mode' is set to 'Always-on', and 'Maximum Idle Time' is set to 300 seconds. The 'NAT disable' checkbox is unchecked. At the bottom of the form are 'Apply' and 'Refresh' buttons.

L2TP

Address Mode: Choose **Static IP** only if your ISP assigns you an IP address. Otherwise, please choose **Dynamic IP**.

L2TP IP Address: Enter the information provided by your ISP (Only applicable for Static IP L2TP).

L2TP Subnet Mask: Enter the information provided by your ISP (Only applicable for Static IP L2TP).

L2TP Gateway IP Address: Enter the information provided by your ISP (Only applicable for Static IP L2TP).

L2TP Server IP Address: IP address of the L2TP server.

Username: User/account name that your ISP provides to you for L2TP dial-up.

Password: Password that your ISP provides to you for L2TP dial-up.

Verify Password: Re-type your password in this field.

Reconnect Mode: Choose **Always-on** when you want to establish L2TP connection all the time. If you choose **Connect-on-demand** the device will establish L2TP connection when local users want to use Internet, and disconnect if no traffic after time period of Maximum Idle Time.

Maximum Idle Time: The time of no activity to disconnect your L2TP session. Set it to 0 or choose **Always-on to** disable this feature.

The screenshot shows the D-Link WAN Service Configuration page. The 'WAN Service' menu is open, showing options for Wizard, Multi-WAN, and IPv6. The 'Internet Connection Type' is set to 'L2TP (Username / Password)'. Under the 'L2TP' section, the 'Address Mode' is set to 'Dynamic IP'. The 'L2TP IP Address', 'L2TP Subnet Mask', 'L2TP Gateway IP Address', and 'L2TP Server IP Address' fields are empty. The 'Username' and 'Password' fields are also empty. The 'Verify Password' field is empty. The 'Reconnect Mode' is set to 'Always-on'. The 'Maximum Idle Time' is set to '000 seconds'. The 'NAT disable' checkbox is unchecked. The 'Apply' and 'Refresh' buttons are at the bottom.

NAT disable: Enabling this option will disable the NAT firewall function of the DWR-961, exposing all connected devices directly to the Internet. This is an advanced feature and not recommended for normal use.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link DWR-961 web interface. At the top, there is a navigation bar with icons for Home, Internet, Wi-Fi, LAN, Advanced, and System. The 'Internet' icon is selected. Below the navigation bar, the 'WAN Service' section is active, showing a list of options: Wizard, Multi-WAN, and IPv6. The main content area is titled 'WAN Service Configuration'. Under 'Internet Connection Type', 'My Internet Connection is' is set to 'L2TP (Username / Password)'. The 'L2TP' section contains the following fields: Address Mode (Dynamic IP selected, Static IP unselected), L2TP IP Address, L2TP Subnet Mask, L2TP Gateway IP Address, L2TP Server IP Address, Username, Password, and Verify Password. The 'Reconnect Mode' is set to 'Always-on' (selected), with 'Connect-on-demand' and 'Manual' as unselected options. The 'Maximum Idle Time' is set to '300 seconds'. The 'NAT disable' checkbox is unselected. At the bottom of the configuration area, there are 'Apply' and 'Refresh' buttons.

4G LTE

Prefer Service Type: Choose whether the DWR-961 should only use 4G networks, or use **Auto Mode** to automatically select a network.

Username: Fill in only if requested by carrier ISP (optional).

Password: Fill in only if requested by carrier (optional).

Verify Password: Re-type your password in this field (optional).

Dialed Number: If your carrier provides a dial-in number or code, enter it here. Empty by default.

Authentication: Select **PAP**, **CHAP**, or **Auto** detection. The default authentication method is **Auto**.

APN: Enter the APN information (optional).

Pin Code: If your SIM card has a PIN code, enter it here

Reconnect Mode: Select **Auto**, **Manual**, or **Connect-on-demand** to determine whether the router should reconnect to your 4G network automatically or manually.

Maximum Idle Time: Set the maximum time your connection can be idle before disconnecting. Set it to 0 or choose **Auto** in Reconnect Mode to disable this feature.

Roaming: Enabling this option will allow you to connect when roaming away from your carrier's home network.

Note: Roaming connections may incur additional fees from your service provider.

The screenshot displays the 'WAN Service Configuration' interface of a D-Link router. The 'Internet Connection Type' is set to '4G LTE /3G'. Under the '4G LTE /3G Internet Connection Type' section, the 'Prefer Service Type' is 'Auto Mode'. Fields for 'Username', 'Password', 'Verify Password', and 'Dialed Number' are present with '(optional)' labels. 'Authentication' is set to 'Auto'. The 'APN' field has a 'Reset' button. 'Pin Code' is empty. 'Reconnect Mode' has radio buttons for 'Auto' (selected), 'Connect-on-demand', and 'Manual'. 'Maximum Idle Time' is set to '300 seconds'. 'Roaming', 'Bridge ethernet ports', 'NAT disable', and 'Transparent Bridge' are all unchecked. 'Radio Frequency' has radio buttons for 'On' (selected) and 'Off'. 'Apply' and 'Refresh' buttons are at the bottom.

Bridge Ethernet Ports: Activate this feature to use the Ethernet WAN port as an additional LAN port.

NAT disable: Enabling this option will disable the NAT function of the DWR-961, allowing it to act as a link for your devices to your Internet connection, but without routing functions.

Transparent Bridge: Enabling the Transparent Bridge function disables the routing/ NAT functions and passes the public WAN IP address given by your service provider directly through to the local client or PC. This can only be used if a single IP address has been assigned by your ISP. If transparent bridge is enabled, the above NAT Disable option will not be available

Radio Frequency: Turns the cellular radio on or off. This setting is intended to disable the cellular radio for areas where radio transmissions may be restricted.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link DWR-961 WAN Service Configuration page. The top navigation bar includes links for Home, Internet, Wi-Fi, LAN, Advanced, and System. The main content area is titled "WAN Service Configuration" and includes a sidebar with "WAN Service" options: Wizard, Multi-WAN, and IPv6. The "Internet Connection Type" section shows "My Internet Connection is" set to "4G LTE / 3G". The "4G LTE / 3G Internet Connection Type" section includes fields for "Prefer Service Type" (Auto Mode), "Username", "Password", "Verify Password", "Dial Number", "Authentication" (Auto), "APN" (Internet), "Pin Code", "Reconnect Mode" (Auto), "Maximum Idle Time" (300 seconds), "Roaming" (Enable), "Bridge ethernet ports" (Enable), "NAT disable" (Enable), "Transparent Bridge" (Enable), and "Radio Frequency" (On/Off). The page concludes with "Apply" and "Refresh" buttons.

Wizard

This wizard will guide you through a step-by-step process to configure your router to connect to the Internet.

Click **Next** to continue.

Note: While using the wizard, you can click **Prev** to go back to the previous step, or you can click **Cancel** to close the wizard.

Select the Internet connection type you use. The connection types are explained on the following page. If you are unsure which connection type you should use, contact your Internet Service Provider (ISP).

Click **Prev** to go back to the previous page or click **Cancel** to close the wizard.

Note: The DWR-961 has a Multi-WAN Failover feature that allows the router to switch to a 4G connection if the WAN connection is down or unavailable. To configure this feature, please refer to **Multi-WAN Configuration on page 24**.

WELCOME TO THE SETUP WIZARD

It appears that you have already successfully connected your new router to the Internet.

- Step 1: Configure your Internet Connection
- Step 2: Configure your Wi-Fi Security
- Step 3: Set your Password
- Step 4: Select your Time Zone
- Step 5: Save Settings and Connect

Prev Next Cancel Connect

STEP 1: CONFIGURE YOUR INTERNET CONNECTION

Please select the Internet connection type below:

- ☒ **DHCP Connection (Dynamic IP Address)**
Choose this if your Internet connection automatically provides you with an IP Address. Most Cable Modems use this type of connection.
- ☐ **Username / Password Connection (PPPoE)**
Choose this option if your Internet connection requires a username and password to get online. Most DSL modems use this type of connection.
- ☐ **Username / Password Connection (PPTP)**
PPTP client.
- ☐ **Username / Password Connection (L2TP)**
L2TP client.
- ☐ **4G LTE / 3G Connection**
4G LTE / 3G.
- ☐ **Static IP Address Connection**
Choose this option if your Internet Setup Provider provided you with IP Address information that has to be manually configured.

Prev Next Cancel Connect

The subsequent configuration pages will differ depending on the selection you make on this page.

DHCP Connection (Dynamic IP Address): Choose this if your IPS automatically provides you with an IP address. Most cable modems use this type of connection. See **Dynamic IP (DHCP)** on page 8 for information about how to configure this type of connection.

Username / Password Connection (PPPoE): Choose this option if your Internet connection requires a username and password to connect. Most DSL modems use this style of connection. See **PPPoE (Username / Password)** on page 11 for information about how to configure this type of connection.

Username / Password Connection (PPTP): Choose this option if your Internet connection requires Point-to-Point Tunneling Protocol (PPTP). See **PPTP** on page 13 for information about how to configure this type of connection.

Username / Password Connection (L2TP): Choose this option if your Internet connection requires Layer 2 Tunneling Protocol (L2TP). See **L2TP** on page 15 for information about how to configure this type of connection.

4G Connection: Choose this connection if you have installed a SIM card into the DWR-961. See **4G LTE** on page 17 for information about how to configure this type of connection.

Static IP Address Connection: Choose this option if your Internet Service Provider (ISP) provided you with IP address information that has to be manually configured. See **Static IP** on page 10 for information about how to configure this type of connection.

After entering the requested information, click **Next** to continue.

Note: If you are not sure what connection type to use or what settings to enter, check with your Internet Service Provider (ISP).

STEP 1: CONFIGURE YOUR INTERNET CONNECTION

Please select the Internet connection type below:

- ☒ **DHCP Connection (Dynamic IP Address)**
 Choose this if your Internet connection automatically provides you with an IP Address. Most Cable Modems use this type of connection.
- ☐ **Username / Password Connection (PPPoE)**
 Choose this option if your Internet connection requires a username and password to get online. Most DSL modems use this type of connection.
- ☐ **Username / Password Connection (PPTP)**
 PPTP client.
- ☐ **Username / Password Connection (L2TP)**
 L2TP client.
- ☐ **4G LTE / 3G Connection**

Save

Choose the best security level supported by your wireless clients. Click **Next** to continue.

STEP 2: CONFIGURE YOUR WI-FI SECURITY

In order to protect your network from hackers and unauthorized users, it is highly recommended you choose one of the following wireless network security settings.

There are three levels of wireless security -Good Security, or Best Security. The level you choose depends on the security features your wireless adapters support.

BEST : ☒

 Select this option if your wireless adapters SUPPORT WPA2

GOOD : ☐

 Select this option if your wireless adapters DO NOT SUPPORT WPA

NONE : ☐

 Select this option if you do not want to activate any security features

For information on which security features your wireless adapters support, please refer to the adapters' documentation.

Note: All wireless adapters currently support WPA.

Multi-WAN

The DWR-961's multi-WAN feature allows you to set your router to automatically switch to a secondary Internet connection if your primary Internet connection is lost. Note that you must first specify your primary Internet connection either on the **WAN Service** tab (see page 8) or the **Wizard** (see "Wizard" on page 19) before you can specify a secondary Internet connection. By default, the primary connection is 4G.

Failover type: Select **Failover** to enable the failover function.

Remote Host for Keep Alive: This option should be set to an external IP address that can be used to ensure that the 4G LTE connection will be kept from going offline due to inactivity. An example would be Google's public DNS servers (8.8.8.8 or 8.8.4.4) or your Internet service provider's DNS servers.

Primary WAN: This will automatically be set to the currently configured Internet connection type.

Secondary WAN: This can be set by clicking on **Add**, the available options will be shown in the drop down box that appears.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

Multi-WAN Configuration

After selecting a secondary WAN and clicking apply, you will be directed to a setup screen for the relevant connection type.

4G LTE failover

Username: Fill in only if requested by your ISP (optional).

Password: Fill in only if requested by you ISP (optional).

Verify Password: Retype password if required above.

Dialed Number: If your ISP provides you with a dial-in number, enter it here. Empty by default.

Authentication: Select **PAP**, **CHAP** or **Auto** if requested by your carrier. The default authentication method is **Auto**.

APN: Enter the **APN** (Access Point Name) for your 4G connection.

Reset: Press **Reset** to restore your APN setting to factory default. This button leaves all other settings unchanged, including those on this page.

Pin Code: If your SIM/UICC card has a PIN, enter it here (optional).

Radio

Frequency: Turns the cellular radio on or off. This setting is intended to disable the cellular radio for areas where radio transmissions may be restricted.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

Static IP Address Failover

IP Address: Enter the IP address assigned to your network connection.

Subnet Mask: Enter the subnet mark.

Default Gateway: Enter the default gateway.

Primary DNS

Server: Enter the primary DNS server.

Secondary DNS

Server: Enter the secondary DNS server.

MTU: You may need to change the Maximum Transmission Unit (MTU) for optimal performance. The default value is 0.

MAC Address: The default MAC address is set to the WAN port's physical interface MAC address. Changing it is not recommended unless required to do so by your ISP. You can use the **Clone** button to replace the WAN port's MAC address with the MAC address of your PC.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the 'Multi-WAN' configuration interface. At the top, the title 'Multi-WAN' is in green. Below it, the section 'Static IP Address Internet Connection Type' is highlighted. The form contains several input fields: 'IP Address', 'Subnet Mask', 'Default Gateway', 'Primary DNS Server', 'Secondary DNS Server', 'MTU' (with a value of 0 and a '(bytes)' label), and 'MAC Address'. A 'Clone' button is located next to the 'MAC Address' field. At the bottom of the form, there are two large blue buttons: 'Apply' and 'Refresh'.

Dynamic IP Failover

Host Name: If your ISP requires you to enter a host name, enter it here. In most cases, you may leave this blank.

Primary DNS

Server: Enter the primary DNS server.

Secondary DNS

Server: Enter the secondary DNS server.

MTU: You may need to change the Maximum Transmission Unit (MTU) for optimal performance. The default value is 0.

MAC Address: The default MAC address is set to the WAN port's physical interface MAC address. Changing it is not recommended unless required to do so by your ISP. You can use the **Clone** button to replace the WAN port's MAC address with the MAC address of your PC.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the 'Multi-WAN' configuration interface. Under the 'Dynamic IP (DHCP) Internet Connection Type' section, there are five input fields: 'Host Name', 'Primary DNS Server', 'Secondary DNS Server', 'MTU' (with a value of 0 and '(bytes)' label), and 'MAC Address'. To the right of the 'MAC Address' field is a 'Clone' button. At the bottom of the section are two large blue buttons: 'Apply' and 'Refresh'.

PPPoE Failover

Username: The username provided by your ISP for your PPPoE account.

Password: The password provided by your ISP for your PPPoE account

Verify Password: Re-type your password in this field.

Service Name: Fill in if provided by your ISP (optional).

IP Address: Fill in if provided by your ISP. If not, keep the default value.

Primary DNS

Server: Enter the primary DNS server.

Secondary DNS

Server: Enter the secondary DNS server.

MAC Address: The default MAC address is set to the WAN port's physical interface MAC address. Changing it is not recommended unless required to do so by your ISP. You can use the **Clone** button to replace the WAN port's MAC address with the MAC address of your PC.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

IPv6

IPv6: To enable IPv6, select **Enable**.

IPv6 Connection: Select the IPv6 connection type specified by your ISP. The corresponding settings will be displayed below. Please see the following sections for details on how to configure these different connection types.

Link-local Only

LAN IPv6 Link-Local Address: Displays the IPv6 address of the router.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

Static IPv6

IPv6 Address: Enter the static IPv6 address of the router.

Subnet Prefix Length: Enter the subnet prefix length.

Default Gateway: Enter the default gateway address.

DNS Addresses: Enter the primary and secondary DNS server addresses.

LAN IPv6 Address: Enter the LAN (local) IPv6 address for the router.

LAN IPv6 Link-Local Address: Displays the router's LAN link-local address.

Enable Autoconfiguration: Check to enable the autoconfiguration feature for LAN devices.

Autoconfiguration Type: Select **Stateful (DHCPv6)** or **SLAAC + Stateless DHCPv6**. This will determine the configuration type for you IPv6 LAN.

IPv6 Address

Range (Start): If you selected **Stateful (DHCPv6)**, enter the address range start.

IPv6 Address

Range (End): If you selected **Stateful (DHCPv6)**, enter the address range end.

Router

Advertisement Lifetime: Enter the IPv6 address lifetime (in seconds).

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link router's web interface for IPv6 configuration. The left sidebar has a menu with options: WAN Service, Wizard, Multi-WAN, and IPv6 (selected). The main content area is titled 'IPv6' and contains the following sections:

- Choose the mode to be used by the router to connect to the IPv6 Internet.**
 - IPv6: ☐ Disable ☒ Enable
 - IPv6 Connection: Static IPv6 (dropdown)
- WAN IPv6 Address Settings**
 - IPv6 Address: [text box]
 - Subnet Prefix Length: [text box]
 - Default Gateway: [text box]
 - Primary DNS Address: [text box]
 - Secondary DNS Address: [text box]
- LAN IPv6 Address Settings**
 - LAN IPv6 Address: [text box]
 - LAN IPv6 Link-Local Address: fe80::4aee:cff:feab:e702 /64
- LAN Address Autoconfiguration Settings**
 - Enable Autoconfiguration: ☐
 - Autoconfiguration Type: Stateful (DHCPv6) (dropdown)
 - IPv6 Address Range(Start): [text box]
 - IPv6 Address Range(End): [text box]
 - IPv6 Address Lifetime: [text box] seconds

At the bottom, there are two buttons: 'Apply' and 'Refresh'.

Autoconfiguration (SLAAC/DHCPv6)

DNS Setting: Select either **Obtain DNS server address automatically** or **Use the following DNS address**.

DNS Addresses: Enter the primary and secondary DNS server addresses.

Enable DHCP-PD: Check to enable the DHCP-PD feature.

LAN IPv6 Address: If you did not enable DHCP-PD, enter the LAN (local) IPv6 address for the router.

LAN IPv6 Link-Local Address: Displays the router's LAN link-local address.

Enable Autoconfiguration: Check to enable the autoconfiguration feature.

Autoconfiguration Type: Select **Stateful (DHCPv6)** or **SLAAC + Stateless DHCPv6**. This will determine the configuration type for your IPv6 LAN.

IPv6 Address

Range (Start): If you selected **Stateful (DHCPv6)**, enter the address range start.

IPv6 Address

Range (End): If you selected **Stateful (DHCPv6)**, enter the address range end.

IPv6 Address

Lifetime: Enter the IPv6 address lifetime (in seconds).

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link router's web interface for IPv6 configuration. The top navigation bar includes links for Home, Internet, Wi-Fi, LAN, Advanced, and System. The left sidebar lists WAN Service, Wizard, Multi-WAN, and IPv6. The main content area is titled 'IPv6' and contains the following sections:

- Choose the mode to be used by the router to connect to the IPv6 Internet:**
 - IPv6: ☐ Disable ☒ Enable
 - IPv6 Connection: Autoconfiguration (SLAAC/DHCPv6)
- IPv6 DNS Settings:**
 - DNS Setting: ☒ Obtain DNS Server address Automatically ☐ Use the following DNS address
 - Primary DNS Address: [text input]
 - Secondary DNS Address: [text input]
- LAN IPv6 Address Settings:**
 - Enable DHCP-PD: ☒
 - LAN IPv6 Address: [text input]
 - LAN IPv6 Link-Local Address: fe80::4aee:cff:feab:e702
- LAN Address Autoconfiguration Settings:**
 - Enable Autoconfiguration: ☐
 - Autoconfiguration Type: Stateful (DHCPv6)
 - IPv6 Address Range(Start): [text input]
 - IPv6 Address Range(End): [text input]
 - IPv6 Address Lifetime: [text input] seconds

At the bottom, there are 'Apply' and 'Refresh' buttons.

PPPoE

Username: Enter your PPPoE user name.

Password: Enter your PPPoE password.

Service Name: Enter the ISP Service Name (optional).

MTU: Maximum Transmission Unit - you may need to change the MTU for optimal performance with your specific ISP.

DNS Setting: Select either **Obtain DNS Server address Automatically** or **Use the following DNS address**.

DNS Addresses: Enter the primary and secondary DNS server addresses.

Enable DHCP-PD: Check to enable the DHCP-PD feature.

LAN IPv6 Address: If you did not enable DHCP-PD, enter the LAN (local) IPv6 address.

LAN IPv6 Link-Local Address: Displays the router's LAN link-local address.

Enable Autoconfiguration: Check to enable the autoconfiguration feature.

Autoconfiguration Type: Select **Stateful (DHCPv6)** or **SLAAC + Stateless DHCPv6**. This will determine the configuration type for you IPv6 LAN.

IPv6 Address

Range (Start): If you selected **Stateful (DHCPv6)**, enter the address range start.

IPv6 Address

Range (End): If you selected **Stateful (DHCPv6)**, enter the address range end.

Wi-Fi

Device List

This page displays a list of currently-connected wireless clients, and their respective MAC addresses.

Wi-Fi Settings

This page lets you set up your wireless network and choose a wireless security mode. Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

Enable Wireless: Check this box to enable wireless access. When you enable this option, the following parameters take effect.

Wireless Network Name: Also known as the SSID (Service Set Identifier), this is the name of your Wireless Local Area Network (WLAN). Enter a name using up to 32 alphanumeric characters. The SSID is case-sensitive.

802.11 Mode: Select the IEEE 802.11 standard used by your wireless clients.

Enable Auto Channel Scan: Enabling this feature will allow the router to automatically scan for the best wireless channel to use.

Wireless Channel: If Auto Channel Scan is disabled, select the desired channel here.

Channel Width: A higher channel width allows for faster data transmission, at the possible expense of wireless coverage and compatibility with older wireless clients. Select the optimum channel width for your wireless network from the drop-down menu.

Visibility Status: The default setting is **Visible**. Select **Invisible** if you do not want to broadcast the SSID of your wireless network.

Security Mode: Select the desired wireless encryption mode. **WPA/WPA2** is recommended if your clients support it.

If you choose **WEP**, the following options will appear:

WEP Key Length: Select whether to use **64-bit** or **128-bit** encryption.

Authentication: Select whether to use **Open** or **Shared** authentication.

WEP Key 1: Set the WEP key/password for your wireless network. Based on whether you are using 64 or 128-bit encryption, and whether you are using a HEX or ASCII key, you will need to enter different numbers of characters for your key, as indicated below the WEP Key text box. ASCII keys may use letters and numbers only, and HEX keys may use numbers 0-9 and letters A-F only.

If you choose **WPA-Personal**, the following options will appear:

WPA Mode: Select whether to use **WPA2 only** or **Auto (WPA or WPA2)**. **WPA2 only** is the most secure, provided that all of your clients support it.

Cipher Type: Select whether to use the **TKIP** or **AES** cipher. The **AES** cipher is the most secure, provided that all of your clients can support it.

Pre-Shared Key: Enter the key/password you want to use for your wireless network. The key must be between 8 and 63 characters long, and may only contain letters and numbers.

WiFi Setting

In this section you can configure the wireless interface (access point) available on the router.

Wireless Band : 2.4GHz Band
Enable Wireless : ☒
Wireless Network Name : DWR-922-E701 (Also called the SSID)
SSID Mode : Mixed 802.11n, 802.11g and 802.11b
Enable Auto Channel Scan : ☒
Wireless Channel : 2.412 GHz - CH 1
Channel Width : 20/40MHz (Auto)
Visibility Status : ☒ Visible ☐ Invisible
Security Mode : WPA Personal
WPA Mode : WPA2 only
Cipher Type : AES
Pre-Shared Key : YUa5T5Rn (8-63 ASCII or 64 HEX)

Apply Refresh

Security Mode : WEP
WEP Key Length : 64bit (10 hex digits) (length applies to all keys)
Authentication : Open
WEP Key 1 : HEX 1234567890 (8-63 ASCII or 10 HEX)

Apply Refresh

Security Mode : WPA Personal
WPA Mode : WPA2 only
Cipher Type : AES
Pre-Shared Key : YUa5T5Rn (8-63 ASCII or 64 HEX)

Apply Refresh

WPS

The Wi-Fi Protected Setup page allows you to create a wireless connection between your router and a device automatically by simply pushing a button or entering a PIN code.

WPS: Select whether you would like to **Enable** or **Disable** WPS features.

AP PIN: If you use Windows 7's **Connect to a network** wizard to do initial configuration of the router, you will have the option to enter the WPS PIN/AP PIN into the wizard when prompted. The factory default WPS PIN/AP PIN is printed on a label located on the bottom of the router. You can click the **Generate New PIN** button to change it to a randomly generated PIN.

Config Mode: Select whether the WPS config mode should be set to **Registrar** or **Enrollee**. In most cases, this should be set to **Registrar** so that you can use WPS to connect new wireless clients.

Config Status: If this is set to **CONFIGURED**, the router will be marked as "already configured" to computers that try to use WPS configuration, such as Windows 7's **Connect to a network** wizard. You can click the **Release** button to change the status to **UNCONFIGURED** to allow for WPS configuration of the router.

If this is set to **UNCONFIGURED**, you can click the **Set** button to change the status to **CONFIGURED** to block WPS configuration of the router.

Disable WPS-PIN Method: Enable this option to prevent clients from connecting to the router using the PIN method. If this option is enabled, clients must use the push-button method to connect.

Config Method: This lets you choose whether to use the **Push Button** connection method (PBC) or **PIN** method to connect to a wireless client when the **Trigger** button is clicked. If you choose the **PIN** method, you will need to enter an 8-digit PIN number that the wireless client needs to use to connect to your router.

WPS status: This will show the current WPS connection process status. Click the **Trigger** button to initiate a WPS connection.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link router's web interface. At the top, there's a navigation bar with icons for Home, Internet, Wi-Fi, LAN, Advanced, and System. The 'Wi-Fi' icon is highlighted. Below the navigation bar, a sidebar menu on the left lists 'Device List', 'Wi-Fi Settings', 'WPS' (which is selected and highlighted in blue), and 'Wi-Fi Advanced'. The main content area is titled 'WPS' in green. Underneath, it says 'Wi-Fi Protected Setup (WPS)' and provides a brief explanation: 'WPS is a standard for easy and secure setup of a wireless connection. In this section you can enable WPS for a connection using WPA/WPA2 security.' The configuration options include: 'WPS' with radio buttons for 'Enable' (selected) and 'Disable'; 'AP PIN' showing '12657940' and a 'Generate New PIN' button; 'Config Mode' with a dropdown menu set to 'Registrar'; 'Config Status' showing 'CONFIGURED' and a 'Release' button; 'Disable WPS PIN Method' with an unchecked checkbox; 'Config Method' with a dropdown menu set to 'Push Button'; and 'WPS status' showing 'CONFIGURED' and a 'Trigger' button. At the bottom of the configuration area are 'Apply' and 'Refresh' buttons.

Wi-Fi Advanced

This page contains settings which can negatively affect the performance of your router if configured improperly. Do not change these settings unless you are already familiar with them or have been instructed to make the change by one of our support personnel.

Beacon Interval: Specify a value for the beacon interval. Beacons are packets sent by an access point to synchronize a wireless network. 100 is the default setting and is recommended.

Transmit Power: Set the transmit power of the antennas.

RTS Threshold: This value should remain at its default setting of 2347. If inconsistent data flow is a problem, only a minor modification should be made.

Fragmentation: The fragmentation threshold, which is specified in bytes, determines whether packets will be fragmented. Packets exceeding the 2346 byte setting will be fragmented before transmission. 2346 is the default setting.

DTIM Interval: Set the interval for DTIM. A Delivery Traffic Indication Message (DTIM) is a countdown informing clients of the next window for listening to broadcast and multicast messages. The default interval is 1.

WMM Capable: WMM (Wi-Fi Multimedia) is a QoS (Quality of Service) system for your wireless network. Enable this option to improve the quality of video and voice applications for your wireless clients.

TX Rates: Select the basic transfer rates based on the speed of wireless adapters on your wireless network. It is strongly recommended to keep this setting to **Best**.

The screenshot displays the D-Link Advanced Wireless Settings interface. The top navigation bar includes icons for Home, Internet, Wi-Fi, LAN, Advanced, and System. The left sidebar shows a menu with 'Device List', 'Wi-Fi Settings', 'WPS', and 'Wi-Fi Advanced' (which is highlighted). The main content area is titled 'Advanced Wireless Settings' and contains a sub-section 'Advanced 2.4G Wireless Settings'. This section includes the following settings:

- Beacon Interval:** 100 (msec, range: 20-1024)
- Transmit Power:** 100% (dropdown menu)
- RTS Threshold:** 2347 (range: 1-2347)
- Fragmentation:** 2346 (range: 256-2346)
- DTIM Interval:** 1 (range: 1-255)
- WMM Capable:** ☒ Enable ☐ Disable
- TX Rates:** Best (dropdown menu)
- Short GI:** ☒
- HT 20/40 Coexistence:** ☒ Enable ☐ Disable

At the bottom of the settings area are 'Apply' and 'Refresh' buttons.

Short GI: Check this box to reduce the guard interval to 400 ns. This can increase the throughput rate provided that the delay spread of the connection is also low. However, it can also increase error rate in some installations, due to increased sensitivity to radio-frequency reflections. Select the option that works best for your installation.

HT 20/40 Coexistence: Enable this option to reduce interference from other wireless networks in your area. If the channel width is operating at 40 MHz and there is another wireless network's channel over-lapping and causing interference, the router will automatically change to 20 MHz.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

LAN

This section will help you to change the local network settings of your router and to configure the DHCP Server settings.

Device List

This page displays a list of currently-connected wired clients, and their respective MAC addresses.

LAN Settings

Router IP Address: Enter the IP address you want to use for the router. The default IP address is **192.168.0.1**. If you change the IP address, you will need to enter the new IP address in your browser to get into the configuration utility.

Default Subnet Mask: Enter the subnet mask of the router. The default subnet mask is **255.255.255.0**.

Local Domain Name: Enter the local domain name for your network.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

DHCP

The DWR-961 has a built-in DHCP (Dynamic Host Control Protocol) server. The DHCP server assigns IP addresses to devices on the network that request them. By default, the DHCP Server is enabled on the device. The DHCP address pool contains a range of IP addresses, which are automatically assigned to the clients on the network.

Enable DHCP Server: Select this box to enable the DHCP server on your router.

DHCP IP Address Range: Enter the range of IPs for the DHCP server to use to assign IP addresses to devices on your network. These values will represent the last octet of the IP addresses in the pool.

DHCP Lease Time: Enter the lease time for IP address assignments.

Primary DNS IP Address: Enter the primary DNS IP address that will be assigned to DHCP clients.

Secondary DNS IP Address: Enter the secondary DNS IP address that will be assigned to DHCP clients.

DHCP Reservation: Click **DHCP Reservation** to assign a dedicated IP to a specified MAC address to be saved by the DHCP server. The Fixed Mapping page will appear.

Select a DHCP client and click **Copy to**, or enter the MAC address and IP address manually, to assign the IP address to the MAC address. Click **Enable** to enable the rule.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link DHCP Server Configuration page. The 'Enable DHCP Server' checkbox is checked. The 'DHCP IP Address Range' is set to 50 to 199. The 'DHCP Lease Time' is set to 3600 seconds. There are input fields for 'Primary DNS IP Address' and 'Secondary DNS IP Address'. At the bottom, there are buttons for 'DHCP Reservation', 'Apply', and 'Refresh'.

The screenshot shows the D-Link DHCP Reservation page. It features a table with columns for ID, MAC Address, IP Address, and Enable. The table has 10 rows. Above the table, there is a dropdown menu for 'DHCP clients' and a 'Copy to' button. Below the table, there are buttons for 'Previous page', 'Next page', and 'Back'. At the bottom, there are buttons for 'Apply' and 'Refresh'.

Advanced DNS

On this page you can configure the Domain Name System (DNS) server, which manages the resolution of host/domain names to IP addresses.

DDNS: Tick this checkbox to enable the DDNS feature.

Provider: Select a DDNS service provider to use.

Host Name: Enter the **Host Name** that you registered with your DDNS service provider.

Username / E-mail: Enter the **Username** for your DDNS account.

Password / Key: Enter the **Password** for your DDNS account.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link Advanced DNS configuration interface. At the top, there's a navigation bar with icons for Home, Internet, Wi-Fi, LAN, Advanced, and System. The 'Advanced' tab is selected. On the left, a sidebar lists various configuration options: DNS (selected), Applications, DMZ, Virtual Server, URL Filter, Routing, QoS, MAC Address Filter, Outbound Filter, Inbound Filter, SNMP, Advanced Network, and Network Scan. The main content area is titled 'DNS' and contains a checkbox for 'DDNS'. Below it, there's a dropdown menu for 'Provider' with 'DynDNS.org(Dynamic)' selected. There are also input fields for 'Host Name', 'Username / E-mail', and 'Password / Key'. At the bottom of the form, there are 'Apply' and 'Refresh' buttons. A small note at the top of the DNS section explains that DNS manages the resolution of IP addresses to host names and vice versa, and that the device can detect available DNS servers.

Applications

Some applications require multiple connections, such as Internet gaming, video conferencing, and Internet telephony. These applications may have difficulty working through NAT (Network Address Translation). **Applications** allows some of these applications to work with the DWR-961 by opening ports after detecting traffic being sent through a trigger port.

Popular Applications: Select from a list of popular applications. You can select a service, select a rule ID, then click the **Copy to** button to copy the default settings for that service to the specified rule ID.

ID: Specifies which rule to copy the selected **Popular applications** settings to when you click the **Copy to** button.

APPLICATION RULES

ID: This identifies the rule.

Trigger: Enter the port to listen to in order to trigger the rule.

Incoming Ports: Specify the incoming port(s) to open when traffic comes over the **Trigger** port.

Enable: Check the box to enable the specified rule.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link web interface for the DWR-961. The 'Applications' tab is selected in the sidebar. The main content area is titled 'Applications' and contains a 'Popular applications' dropdown menu, a 'Copy to' button, and an 'ID' dropdown menu. Below this is a table titled 'Application Rules' with the following columns: ID, Trigger, Incoming Ports, and Enable. The table contains 12 rows, each with an ID from 1 to 12, empty input fields for Trigger and Incoming Ports, and an unchecked checkbox for Enable. At the bottom of the table are 'Apply' and 'Refresh' buttons.

ID	Trigger	Incoming Ports	Enable
1			☐
2			☐
3			☐
4			☐
5			☐
6			☐
7			☐
8			☐
9			☐
10			☐
11			☐
12			☐

DMZ

Sometimes you may want a computer exposed to the Internet for certain types of applications. If you choose to expose a computer, you can enable Demilitarized Zone (DMZ). This option will expose the chosen computer completely to the Internet. This is not recommended for normal use.

Enable SPI: Enabling Stateful Packet Inspection (SPI) helps to prevent cyber attacks by validating that the traffic passing through the session conforms to the protocol.

Enable DMZ: If an application has trouble working from behind the router, you can expose one computer to the Internet and run the application on that computer.

Note: Placing a computer in the DMZ may expose that computer to a variety of security risks. Use of this option is only recommended as a last resort.

DMZ IP Address: Specify the IP address of the computer on the LAN that you want to have unrestricted Internet communication. If this computer obtains its IP address automatically using DHCP, be sure to make a static reservation on the **LAN > DHCP > DHCP Reservation** page so that the IP address of the DMZ machine does not change.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

Virtual Server

The device can be configured as a virtual server so that users can access services such as Web or FTP via the public (WAN) IP address of the router. You can also allow the settings to run on a specified schedule.

Well-known Services: This contains a list of pre-defined services. You can select a service, select a rule ID, then click the **Copy to** button to copy the default settings for that service to the specified rule ID.

ID: Specifies which rule to copy the selected **Well known service** settings to when you click the **Copy to** button.

Use schedule rule: Select a schedule to use and copy to the specified rule ID when you click the **Copy to** button. You may select **Always On** or use a specific schedule that you have defined. To create and edit schedules, please refer to **Schedules** on page 59.

VIRTUAL SERVERS LIST

ID: This identifies the rule.

Service Ports Enter the public port(s) you want to open.

Server IP: Port: Enter the IP address and port of the computer on your local network that you want to forward the Service Ports to.

Enable: Check the box to enable the specified rule.

Schedule Rule #: Specify the schedule rule number. To create schedules, click on the **Add New Rule** button. For further information on schedules, please refer to **Schedules** on page 59.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

Virtual Server

The Externally acts as server. It receives the requests of remote users under its public IP address and forwards them automatically in the Virtual Server. So a client in your network behind NAT or firewall can provide services as a Virtual Server. You just have to enable specific ports or port ranges and protocols (UDP/TCP). File sharing or web services for e.g. HTTP, FTP or POP3 are possible. The private IP addresses of the servers in the local network remain safe. If you have a dynamic IP address, you may want to enable DynDNS additionally.

Well known services: — Select one — Copy to ID: —

Use schedule rule: — ALWAYS ON —

Virtual Servers List

ID	Service Ports	Server IP: Port	Enable	Schedule Rule
1		:	☐	Add New Rule...
2		:	☐	Add New Rule...

URL Filter

URL Filter allows you to set up a list of websites that will be blocked from users on your network.

URL Filtering: Check the box to enable URL Filtering.

URL FILTERING RULES

ID: This identifies the rule.

URL: Enter URL that you would like to block. All URLs that begin with this address will be blocked.

Enable: Check the box to enable the specified rule.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

Routing

The **Routing** page allows you to specify custom routes that determine how data is moved around your network.

RIP: Check the box to enable routing, then select which routing protocol to use:

- **RIPv1:** Protocol in which the IP address is routed through the Internet.
- **RIPv2:** Enhanced version of RIPv1 with added features such as authentication, routing domain, next hop forwarding, and subnet-mask exchange.

ROUTING RULES

ID: This identifies the rule.

Destination: Enter in the IP of the specified network that you want to access using the static route.

Subnet Mask: Enter in the subnet mask to be used for the specified network.

Gateway: Enter in the gateway IP address for the specified network.

Hop: Enter in the amount of hops it will take to reach the specified network.

Note: In a transmission path, each link is terminated at a network device such as a router or gateway. The number of hops equals the number of routers or gateways that data must pass through before reaching the destination.

Enable: Select this box to enable the rule.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link web interface. The top navigation bar includes links for Home, Internet, Wi-Fi, LAN, Advanced, and System. The left sidebar lists various configuration options, with 'Routing' highlighted. The main content area is titled 'Routing' and contains the following sections:

RIP Setting

RIP: ☐ Enable ☒ RIPv1 ☐ RIPv2

Routing Rules

ID	Destination	Subnet Mask	Gateway	Hop	Enable
1					☐
2					☐
3					☐
4					☐
5					☐
6					☐
7					☐
8					☐

At the bottom of the table are two buttons: 'Apply' and 'Refresh'.

QoS

The **QoS Engine** improves your online gaming or streaming media experience by ensuring that your game or media traffic is prioritized over other network traffic, such as FTP or web.

Enable QoS Packet Filter: Select this box to enable the QoS feature.

Upstream Bandwidth: Specify the maximum upstream bandwidth here (e.g. 400 Kbps).

Use Schedule Rule: Select a schedule to use and copy to the specified rule ID when you click the **Copy to** button. You may select **Always On** or use a specific schedule that you have defined. To create and edit schedules, please refer to **Schedules** on page 59.

QOS RULES

ID: This identifies the rule.

Local IP : Ports: Specify the local IP address(es) and port(s) for the rule to affect.

Remote IP : Ports: Specify the remote IP address(es) and port(s) for the rule to affect.

QoS Priority: Select what priority level to use for traffic affected by the rule:
Low, Normal, or High.

Enable: Check the box to enable the specified rule.

Use Rule #: Specify the schedule rule number. To create a new schedule, click on the **Add New Rule** button. For more information about schedules, please refer to **Schedules** on page 59.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

QoS Engine Setup

Enable QoS Packet Filter: ☐

Upstream bandwidth: Mbps

Use schedule rule: ALWAYS ON ID:

QoS Rules

ID	Local IP : Ports	Remote IP : Ports	QoS Priority	Enable	Use Rule#
1			High	☐	Add New Rule...
2			High	☐	Add New Rule...
3			High	☐	Add New Rule...
4			High	☐	Add New Rule...
5			High	☐	Add New Rule...
6			High	☐	Add New Rule...
7			High	☐	Add New Rule...
8			High	☐	Add New Rule...

MAC Address Filter

The **MAC (Media Access Controller) Address Filter** option is used to control network access based on the MAC address of the network adapter. A MAC address is a unique ID assigned by the manufacturer of the network adapter. This feature can be configured to **ALLOW** or **DENY** network/Internet access.

MAC Address Control: Check this box to enable MAC Filtering.

Connection Control: Check the box to allow wireless and wired clients with **C** selected to connect to this device. You can also select to **allow** or **deny** connections from unspecified MAC addresses.

Association Control: Check the box to allow wireless clients with **A** selected can associate to the wireless LAN. You can also select to **allow** or **deny** connections from unspecified MAC addresses.

MAC FILTERING RULES

ID: This identifies the rule.

MAC Address: Specify the MAC address of the computer to be filtered.

IP Address: Specify the last section of the IP address.

C: If this box is ticked, the rule will follow the connection control setting specified in MAC filtering settings specified above.

A: If this box is ticked, the rule will follow the association control setting specified in MAC filtering settings specified above.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link web interface for the MAC Address Filter. The left sidebar lists various settings, with 'MAC Address Filter' selected. The main content area is titled 'MAC Address Filter' and contains the following sections:

- MAC Filtering Settings:**
 - MAC Address Control:** ☐ Enable. Below this, there are two options: 'Connection control' (unchecked) and 'Association control' (unchecked). Each option has a description and a dropdown menu set to 'allow'.
 - DHCP clients:** A dropdown menu set to 'Select one' and a 'Copy to' button.
- MAC Filtering Rules:** A table with 5 rows and 4 columns: ID, MAC Address, C, and A.

ID	MAC Address	C	A
1		☐	☐
2		☐	☐
3		☐	☐
4		☐	☐
5		☐	☐

At the bottom of the page, there are buttons for 'Previous page', 'Next page', 'Apply', and 'Refresh'.

Outbound Filter

Outbound Filter enables you to control what packets are allowed to be sent out to the Internet. The outbound filter applies to all outbound packets.

Outbound Filter: Select this box to **Enable** outbound filtering.

Use Schedule Rule: Select a schedule to use and copy to the specified rule ID when you click the **Copy to** button. You may select **Always On** or use a specific schedule that you have defined. To create and edit schedules, please refer to **Schedules** on page 59.

OUTBOUND FILTER RULES LIST

Here, you can select whether to **Allow** or **Deny** all outgoing traffic except for traffic that matches the listed rules.

ID: This identifies the rule.

Source IP : Ports: Specify the local IP address and then specify the port after the colon.

Destination IP :

Ports: Specify the remote IP address and then the port after the colon.

Enable: Check the box to enable the specified rule.

Schedule Rule #: Specify the schedule rule number. Click on the **Add New Rule** button to create a new schedule rule.

Previous Page: Go back to the previous filter page.

Next Page: Advance to the next filter page.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

SNMP

SNMP (Simple Network Management Protocol) is a widely used network monitoring and control protocol that reports activity on each network device to the administrator of the network. SNMP can be used to monitor traffic and statistics of the DWR-961. The DWR-961 supports SNMP v1 and v2c.

SNMP Local: Select whether to **Enable** or **Disable** local SNMP administration.

SNMP Remote: Select whether to **Enable** or **Disable** remote SNMP administration.

Get Community: Enter the password **public** in this field to allow read-only access to network administration using SNMP. You can view the network, but no configuration is possible with this setting.

Set Community: Enter the password **private** in this field to enable read/write access to the network using SNMP.

IP 1/IP 2/IP 3/IP 4: Enter up to 4 IP addresses to use as trap targets for your network.

SNMP Version: Select the SNMP version of your system.

WAN Access

IP Address If you want to limit remote access SNMP access, enter the IP address of the remote computer you will use to access this device; all other IP addresses will be denied remote SNMP access.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link web interface for the DWR-961. The top navigation bar includes icons for Home, Internet, Wi-Fi, LAN, Advanced, and System. The left sidebar lists various configuration categories, with 'SNMP' currently selected. The main panel displays the 'SNMP' configuration page. It includes radio buttons for 'SNMP Local' and 'SNMP Remote' (both set to 'Enable'). Below these are input fields for 'Get Community' and 'Set Community'. There are four input fields for 'IP 1', 'IP 2', 'IP 3', and 'IP 4'. The 'SNMP Version' is set to 'V1' (radio button selected). At the bottom, there is a 'WAN Access IP Address' field. 'Apply' and 'Refresh' buttons are at the bottom of the form. A copyright notice 'Copyright © 2012 All Rights Reserved' is visible in the bottom right corner.

Advanced Network

Advanced Network contains settings which can change the way the router handles certain types of traffic. We recommend that you do not change any of these settings unless you are already familiar with them or have been instructed to make the change by one of our support personnel.

Enable UPnP: Check the box to enable the Universal Plug and Play (UPnP™) feature. UPnP provides compatibility with various networking equipment, software, and peripherals.

Enable WAN Ping Respond: Select the box to allow the WAN port to be “pinged.” Blocking WAN pings may provide some extra security from hackers.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

Network Scan

This page lets you set whether to allow the DWR-961 to automatically select a 4G network based on the inserted SIM/UICC card, and allows you to manually scan for networks and select one to connect to.

4G Network Selection Method: Leave this setting on **Auto** to allow the DWR-961 to automatically select a cellular network to connect to. If you need to select a network manually, select **Manual**, click the **Scan** button, then select an available network to connect to.

Note: You will only be able to scan for networks if the DWR-961 is not currently connected to a 4G network.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

System Time Settings

This section will help you set the time zone that you are in and an NTP (Network Time Protocol) server to use. Daylight Saving can also be configured to adjust the time when needed.

Time Zone: Select the appropriate **Time Zone** from the drop-down box.

Enable Daylight Saving: Check the box to allow for daylight saving adjustments. Use the drop-down boxes to specify a start date and end date for daylight saving time adjustments.

Sync your computer's time settings: This button allows the router to set time zone and current time based on your computer's configuration. To use this setting, ensure that Automatic Synchronization is unchecked and applied.

Automatically synchronize with Internet time server: Check the box to allow the router to use an NTP server to update the router's internal clock.

NTP Server Used: Enter an NTP server to use for time synchronization, or use the drop-down box to select one. Click the **Update Now** button to synchronize the time with the NTP server.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link router's web interface for Time Settings. The top navigation bar includes links for Home, Internet, Wi-Fi, LAN, Advanced, and System. The left sidebar lists various settings categories, with 'Time Settings' selected. The main content area is titled 'Time Settings' and contains the following fields and options:

- Time:** Mon Dec 31, 2012 19:37:44
- Time Zone:** (GMT -12:00) Eniwetok, Kwajalein
- Enable Daylight Saving:** ☒
- Start:** 01 / 1 / Jan (Hour:Day:Month)
- End:** 23 / 31 / Dec (Hour:Day:Month)
- Sync:** your computer's time settings
- Automatically synchronize with Internet time server:** ☒
- NTP Server Used:** time.nist.gov
- Update Now:**
- Sync. RESULT:**
 -

Administration

The **Admin** page allows you to change the Administrator password and enable Remote Management. The admin has read/write access while users only have read-only access. Only the admin has the ability to change both admin and user account passwords.

Admin Password: Enter and confirm the password that the admin account will use to access the router's management interface.

Remote Management: Tick this check box to enable remote management. Remote management allows the DWR-961 to be configured over the Internet through a web browser. A username and password will still be required to access the web-management interface.

IP Allowed to Access: Enter the Internet IP address of the PC that has access to the broadband router. If you enter an asterisk (*) in this field, then anyone will be able to access the router. Adding an asterisk (*) into this field could present a security risk and is not recommended.

Port: This is the port number used to access the router. 8080 is the port usually used for the web-management interface.

Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

The screenshot shows the D-Link web management interface. At the top, there's a navigation bar with icons for Home, Internet, Wi-Fi, LAN, Advanced, and System. The 'Administration' section is highlighted in the left sidebar. The main content area is titled 'Administration' and contains the following fields:

- Administrator Settings:**
 - New Password: [Text input field]
 - Confirm Password: [Text input field]
- Remote Administration:**
 - Enable Remote Management: ☐ Enable
 - IP Allowed to Access: [Text input field]
 - Port: [Dropdown menu showing 1080]

At the bottom of the form are two buttons: 'Apply' and 'Refresh'.

Reboot & Reset

Here, you can save the current system settings to a local hard drive.

Save Settings To Local Hard Drive Use this option to save your current router configuration settings to a file. Click **Save** to open a file dialog, and then select a location and file name for the settings.

Load Settings From Local Hard Drive: Use this option to load previously saved router configuration settings. Click **Choose File** and select the saved file and then click the **Upload Settings** button to upload the settings to the router.

Restore To Factory Default Settings: This option will restore all settings back to their defaults. Any settings that have not been backed up will be lost, including any rules that you have created.

Reboot the Device: This option will reboot the router.

Firmware Upgrade

Here, you can upgrade the firmware of your router. Make sure the firmware you want to use is on the local hard drive of the computer and then click **Browse** to upload the file. You can check for and download firmware updates at the D-Link support site at <http://support.dlink.com>.

Current Firmware Version: Displays your current firmware's version.

Current Firmware Date: Displays your current firmware's release date.

Select Firmware: After you have downloaded a new firmware, click **Browse** to locate the firmware on your computer, then click **Upload** to start the firmware upgrade.

Warning: You must use a wired connection to upload the firmware file; do not use a wireless connection. During the upgrade process, do not power off your computer or router, and do not refresh the browser window until the upgrade is complete.

Accept Unofficial Firmware: If the firmware you want to install is not an official D-Link release, you will need to check this box.

Warning: Unofficial firmware is not supported, and may cause damage to your device. Use of unofficial firmware is at your own risk.

System Logs

The DWR-961 keeps a running log of events and activities occurring on the router. You may send these logs to a Syslog server on your network.

- Enable Logging to Syslog Server:

Check the box to send the router logs to a Syslog server.
- Syslog Server IP Address:

Enter the IP address of the Syslog server that the router will send the logs to.
- Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

Schedules

This section allows you to manage schedule rules for various firewall and parental control features. Click **Apply** to save your settings, or **Refresh** to revert to your previous settings.

Enable Schedule: Check this box to enable schedules.

Edit: Click this icon to edit the selected rule. (see below)

Delete: Click this icon to delete the selected rule.

Previous Page: Click this button to go to the previous page of rules.

Next Page: Click this button to go to the next page of rules.
Click this button to specify the start time, end time, and name of the rule.

Add New Rule..: Click this button to create a new rule. (see below)

Add New Rule

Name of Rule #: Enter a name for your new schedule.

Policy: Select Activate or Inactivate to decide whether features that use the schedule should be active or inactive except during the times specified.

Week Day: Select a day of the week for the start time and end time.

Start Time (hh:mm): Enter the time at which you would like the schedule to become active.

End Time (hh:mm): Select the time at which you would like the schedule to become inactive.

Connection Reset

This feature allows you to reset the Internet connection on your router by periodically resetting the connection. You can choose to have this happen on a predetermined schedule by configuring the options on this page.

Auto-Reboot: Select whether the connection reset feature should be enabled or disabled.

Reboot-Schedule: If the connection reset feature is enabled, select when it should activate via the hour and minute from the dropdown boxes.

Daily Schedule: Select this option if you want the connection reset feature to activate on a daily schedule.

Weekly Schedule Day of Week: Select this option if you want the connection reset feature to activate only on a certain day of the week.

Date of Month: Select this option if you want the connection reset feature to activate only on a certain day of the month.

Connect a Wireless Client to your Router

WPS Button

The easiest and most secure way to connect your wireless devices to the router is with WPS (Wi-Fi Protected Setup). Most wireless devices such as wireless adapters, media players, Blu-ray DVD players, wireless printers and cameras will have a WPS button (or a software utility with WPS) that you can press to connect to the DWR-961 router. Please refer to your user manual for the wireless device you want to connect to make sure you understand how to enable WPS. Once you know, follow the steps below:

Step 1 - Press the WPS button on the DWR-961 for about 6 seconds. The WLAN LED on the front will start to blink.

Step 2 - Within 2 minutes, press the WPS button on your wireless client (or launch the software utility and start the WPS process).

Step 3 - Allow up to 1 minute for your connection to be configured. Once the Internet light stops blinking, you will be connected and your wireless connection will be secure with WPA2.

Connecting to a Wireless Network

Windows® 10

To connect to a wireless network using Windows 10, you will need to know the wireless network name (SSID) and Wi-Fi password (security key) of the device you are connecting to.

To join an existing network, locate the wireless network icon in the taskbar, next to the time display and click on it.

Wireless Icon

Clicking on this icon will display a list of wireless networks which are within range of your computer. Select the desired network by clicking on its SSID.

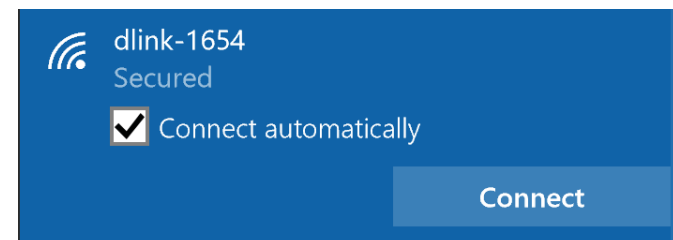

To connect to the network, click **Connect**.

To automatically connect when your device is in range, click the **Connect Automatically** check box. Your computer will now automatically connect to this wireless network whenever it is detected.

You will then be prompted to enter the Wi-Fi password (network security key) for the wireless network. Enter the password into the box and click **Next** to connect to the network.

You can also use Wi-Fi Protected Setup (WPS) to connect to the wireless network. Press the WPS button on your device and you will be automatically connected.

It may take 20-30 seconds to connect to the wireless network. If the connection fails, please verify that the security settings are correct. The key or passphrase must be exactly the same as the one on the wireless router.

Windows® 8

WPA/WPA2

It is recommended that you enable wireless security (WPA/WPA2) on your wireless router or access point before configuring your wireless adapter. If you are joining an existing network, you will need to know the security key (Wi-Fi password) being used.

To join an existing network, locate the wireless network icon in the taskbar next to the time display.

Clicking on this icon will display a list of wireless networks that are within connecting proximity of your computer. Select the desired network by clicking on the network name.

You will then be prompted to enter the network security key (Wi-Fi password) for the wireless network. Enter the password into the box and click **Next**.

If you wish to use Wi-Fi Protected Setup (WPS) to connect to the router, you can also press the WPS button on your router during this step to enable the WPS function.

When you have established a successful connection to a wireless network, the word **Connected** will appear next to the name of the network to which you are connected to.

Windows® 7

WPA/WPA2

It is recommended that you enable wireless security (WPA/WPA2) on your wireless router or access point before configuring your wireless adapter. If you are joining an existing network, you will need to know the security key or passphrase being used.

1. Click on the wireless icon in your system tray (lower-right corner).

Wireless Icon

2. The utility will display any available wireless networks in your area.

3. Highlight the wireless connection with Wi-Fi name (SSID) you would like to connect to and click the **Connect** button.

If you get a good signal but cannot access the Internet, check your TCP/IP settings for your wireless adapter. Refer to **Networking Basics** on page 88 for more information.

4. The following window appears while your computer tries to connect to the router.

5. Enter the same security key or passphrase (Wi-Fi password) that is on your router and click **Connect**. You can also connect by pushing the WPS button on the router.

It may take 20-30 seconds to connect to the wireless network. If the connection fails, please verify that the security settings are correct. The key or passphrase must be exactly the same as the one on the wireless router.

WPS

The WPS feature of the DWR-961 can be configured using Windows® 7. Carry out the following steps to use Windows® 7 to configure the WPS feature:

1. Click the **Start** button and select **Computer** from the Start menu.

2. Click **Network** on the left side.

3. Double-click the DWR-961.

4. Input the WPS PIN number (on the router label) in the **Setup > Wireless Setup** menu in the Router's Web UI) and click **Next**.

5. Type a name to identify the network.

6. To configure advanced settings, click the  icon.

Click **Next** to continue.

7. The following window appears while the router is being configured.

Wait for the configuration to complete.

8. The following window informs you that WPS on the router has been set up successfully.

Make a note of the security key as you may need to provide this security key if adding an older wireless device to the network in the future.

9. Click **Close** to complete WPS setup.

Windows Vista®

Windows Vista® users may use the built-in wireless utility. If you are using another company's wireless utility, please refer to the user manual of your wireless adapter for help connecting to a wireless network. Most wireless utilities will have a "site survey" option similar to the Windows Vista® utility as seen below.

If you receive the **Wireless Networks Detected** bubble, click on the center of the bubble to access the utility.

or

Right-click on the wireless computer icon in your system tray (lower-right corner next to the time). Select **Connect to a network**.

The utility will display any available wireless networks in your area. Click on a network (displayed using the SSID) and click the **Connect** button.

If you get a good signal but cannot access the Internet, check you TCP/IP settings for your wireless adapter. Refer to the **Networking Basics** section in this manual for more information.

WPA/WPA2

It is recommended that you enable wireless security (WPA/WPA2) on your wireless router or access point before configuring your wireless adapter. If you are joining an existing network, you will need to know the security key or passphrase being used.

1. Open the Windows Vista® Wireless Utility by right-clicking on the wireless computer icon in your system tray (lower right corner of screen). Select **Connect to a network**.

2. Highlight the Wi-Fi name (SSID) you would like to connect to and click **Connect**.

3. Enter the same security key or passphrase (Wi-Fi password) that is on your router and click **Connect**.

It may take 20-30 seconds to connect to the wireless network. If the connection fails, please verify that the security settings are correct. The key or passphrase must be exactly the same as the one on the wireless router.

Windows® XP

Windows® XP users may use the built-in wireless utility (Zero Configuration Utility). The following instructions are for Service Pack 2 users. If you are using another company's utility, please refer to the user manual of your wireless adapter for help with connecting to a wireless network. Most utilities will have a "site survey" option similar to the Windows® XP utility as seen below.

If you receive the **Wireless Networks Detected** bubble, click on the center of the bubble to access the utility.

or

Right-click on the wireless computer icon in your system tray (lower-right corner next to the time). Select **View Available Wireless Networks**.

The utility will display any available wireless networks in your area. Click on a Wi-Fi network (displayed using the SSID) and click the **Connect** button.

If you get a good signal but cannot access the Internet, check your TCP/IP settings for your wireless adapter. Refer to the **Networking Basics** section in this manual for more information.

WPA/WPA2

It is recommended to enable WPA on your wireless router or access point before configuring your wireless adapter. If you are joining an existing network, you will need to know the WPA key being used.

1. Open the Windows® XP Wireless Utility by right-clicking on the wireless computer icon in your system tray (lower-right corner of screen). Select **View Available Wireless Networks**.

2. Highlight the Wi-Fi network (SSID) you would like to connect to and click **Connect**.

3. The **Wireless Network Connection** box will appear. Enter the WPA-PSK Wi-Fi password and click **Connect**.

It may take 20-30 seconds to connect to the wireless network. If the connection fails, please verify that the WPA-PSK settings are correct. The Wi-Fi password must be exactly the same as on the wireless router.

Troubleshooting

This chapter provides solutions to problems that can occur during the installation and operation of the DWR-961. Read the following descriptions if you are having problems. The examples below are illustrated in Windows® XP. If you have a different operating system, the screenshots on your computer will look similar to these examples.

1. Why can't I access the web-based configuration utility?

When entering the IP address of the D-Link router (**192.168.0.1** for example), you are not connecting to a website, nor do you have to be connected to the Internet. The device has the utility built-in to a ROM chip in the device itself. Your computer must be on the same IP subnet to connect to the web-based utility.

- Make sure you have an updated Java-enabled web browser. We recommend the following:
 - Microsoft Internet Explorer® 7 or higher
 - Mozilla Firefox 3.5 or higher
 - Google™ Chrome 8 or higher
 - Apple Safari 4 or higher
- Verify physical connectivity by checking for solid link lights on the device. If you do not get a solid link light, try using a different cable, or connect to a different port on the device if possible. If the computer is turned off, the link light may not be on.
- Disable any Internet security software running on the computer. Software firewalls such as ZoneAlarm, BlackICE, Sygate, Norton Personal Firewall, and Windows® XP firewall may block access to the configuration pages. Check the help files included with your firewall software for more information on disabling or configuring it.

- Configure your Internet settings:
 - Go to **Start > Settings > Control Panel**. Double-click the **Internet Options** icon. From the **Security** tab, click the button to restore the settings to their defaults.
 - Click the **Connection** tab and set the dial-up option to Never Dial a Connection. Click the LAN Settings button. Make sure nothing is checked. Click **OK**.
 - Go to the **Advanced** tab and click the button to restore these settings to their defaults. Click **OK** three times.
 - Close your web browser (if open) and open it.
- Access the web management. Open your web browser and enter the IP address of your D-Link router in the address bar. This should open the login page for your web management.
- If you still cannot access the configuration, unplug the power to the router for 10 seconds and plug back in. Wait about 30 seconds and try accessing the configuration. If you have multiple computers, try connecting using a different computer.

2. What can I do if I forgot my password?

If you forgot your password, you must reset your router. This process will change all your settings back to the factory defaults.

To reset the router, locate the reset button (hole) on the rear panel of the unit. With the router powered on, use a paperclip to hold the button down for 10 seconds. Release the button and the router will go through its reboot process. Wait about 30 seconds to access the router. The default IP address is **192.168.0.1**. When logging in, leave the password box empty.

3. Why can't I connect to certain sites or send and receive emails when connecting through my router?

If you are having a problem sending or receiving email, or connecting to secure sites such as eBay, banking sites, and Hotmail, we suggest lowering the MTU in increments of ten (Ex. 1492, 1482, 1472, etc).

To find the proper MTU Size, you'll have to do a special ping of the destination you're trying to go to. A destination could be another computer, or a URL.

- Click on **Start** and then click **Run**.
- Windows® 95, 98, and Me users type in **command** (Windows® NT, 2000, XP, Vista®, and 7 users type in **cmd**) and press **Enter** (or click **OK**).
- Once the window opens, you'll need to do a special ping. Use the following syntax:

ping [url] [-f] [-l] [MTU value]

Example: **ping yahoo.com -f -l 1472**

```
C:\>ping yahoo.com -f -l 1482

Pinging yahoo.com [66.94.234.13] with 1482 bytes of data:

Packet needs to be fragmented but DF set.
Packet needs to be fragmented but DF set.
Packet needs to be fragmented but DF set.
Packet needs to be fragmented but DF set.

Ping statistics for 66.94.234.13:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\>ping yahoo.com -f -l 1472

Pinging yahoo.com [66.94.234.13] with 1472 bytes of data:

Reply from 66.94.234.13: bytes=1472 time=93ms TTL=52
Reply from 66.94.234.13: bytes=1472 time=109ms TTL=52
Reply from 66.94.234.13: bytes=1472 time=125ms TTL=52
Reply from 66.94.234.13: bytes=1472 time=203ms TTL=52

Ping statistics for 66.94.234.13:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 93ms, Maximum = 203ms, Average = 132ms

C:\>
```

You should start at 1472 and work your way down by 10 each time. Once you get a reply, go up by 2 until you get a fragmented packet. Take that value and add 28 to the value to account for the various TCP/IP headers. For example, let's say that 1452 was the proper value, the actual MTU size would be 1480, which is the optimum for the network we're working with ($1452+28=1480$).

Once you find your MTU, you can now configure your router with the proper MTU size.

To change the MTU rate on your router follow the steps below:

- Navigate to the Internet configuration page (see **Internet** on page 8 for details).
- To change the MTU, enter the number in the MTU field and click **Apply** to save your settings.
- Test your email. If changing the MTU does not resolve the problem, continue changing the MTU in increments of ten.

Wireless Basics

D-Link wireless products are based on industry standards to provide easy-to-use and compatible high-speed wireless connectivity within your home, business, or public access wireless networks. Strictly adhering to the IEEE standard, the D-Link wireless family of products will allow you to securely access the data you want, when, and where you want it. You will be able to enjoy the freedom that wireless networking delivers.

A wireless local area network (WLAN) is a cellular computer network that transmits and receives data with radio signals instead of wires. Wireless LANs are used increasingly in both home and office environments, and public areas such as airports, coffee shops and universities. Innovative ways to utilize WLAN technology are helping people work, and communicate more efficiently. Increased mobility and the absence of cabling and other fixed infrastructure have proven to be beneficial for many users.

Wireless users can use the same applications they use on a wired network. Wireless adapter cards used on laptop and desktop systems support the same protocols as Ethernet adapter cards.

Under many circumstances, it may be desirable for mobile network devices to link to a conventional Ethernet LAN in order to use servers, printers or an Internet connection supplied through the wired LAN. A wireless router is a device used to provide this link.

What is Wireless?

Wireless or Wi-Fi technology is another way of connecting your computer to the network without using wires. Wi-Fi uses radio frequency to connect wirelessly so you have the freedom to connect computers anywhere in your home or office network.

Why D-Link Wireless?

D-Link is the worldwide leader and award winning designer, developer, and manufacturer of networking products. D-Link delivers the performance you need at a price you can afford. D-Link has all the products you need to build your network.

How does wireless work?

Wireless works similarly to how cordless phones work, through radio signals that transmit data from one point A to point B. But wireless technology has restrictions as to how you can access the network. You must be within the wireless network range area to be able to connect your computer. There are two different types of wireless networks: Wireless Local Area Network (WLAN), and Wireless Personal Area Network (WPAN).

Wireless Local Area Network (WLAN)

In a wireless local area network, a device called an Access Point (AP) connects computers to the network. The access point has a small antenna attached to it, which allows it to transmit data back and forth over radio signals. With an indoor access point the signal can travel up to 300 feet. With an outdoor access point the signal can reach out up to 30 miles to serve places like manufacturing plants, industrial locations, university and high school campuses, airports, golf courses, and many other outdoor venues.

Wireless Personal Area Network (WPAN)

Bluetooth is the industry standard wireless technology used for WPAN. Bluetooth devices in WPAN operate in a range up to 30 feet away.

Compared to WLAN the speed and wireless operation range are both less than WLAN, but in return it doesn't use nearly as much power. This makes it ideal for personal devices, such as mobile phones, PDAs, headphones, laptops, speakers, and other devices that operate on batteries.

Who uses wireless?

Wireless technology has become so popular in recent years that almost everyone is using it, whether it's for home, office, business, D-Link has a wireless solution for it.

Home Uses/Benefits

- Gives everyone at home broadband access
- Surf the web, check email, instant message, etc.
- Gets rid of the cables around the house
- Simple and easy to use

Small Office and Home Office Uses/Benefits

- Stay on top of everything at home as you would at office
- Remotely access your office network from home
- Share Internet connection and printer with multiple computers
- No need to dedicate office space

Where is wireless used?

Wireless technology is expanding everywhere, not just at home or office. People like the freedom of mobility and it's becoming so popular that more and more public facilities now provide wireless access to attract people. The wireless connection in public places is usually called "hotspots".

Using a D-Link CardBus Adapter with your laptop, you can access the hotspot to connect to the Internet from remote locations like: airports, hotels, coffee shops, libraries restaurants, and convention centers.

Wireless network is easy to setup, but if you're installing it for the first time it could be quite a task not knowing where to start. That's why we've put together a few setup steps and tips to help you through the process of setting up a wireless network.

Tips

Here are a few things to keep in mind, when you install a wireless network.

Centralize your router or access point

Make sure you place the router/access point in a centralized location within your network for the best performance. Try to place the router/access point as high as possible in the room, so the signal gets dispersed throughout your home. If you have a two-story home, you may need a repeater to boost the signal to extend the range.

Eliminate interference

Place home appliances such as cordless telephones, microwaves, and televisions as far away as possible from the router/access point. This would significantly reduce any interference that the appliances might cause since they operate on same frequency.

Security

Don't let your next-door neighbors or intruders connect to your wireless network. Secure your wireless network by turning on the WPA or WEP security feature on the router. Refer to the product manual for detail information on how to set it up.

Wireless Modes

There are basically two modes of networking:

- **Infrastructure** – All wireless clients will connect to an access point or wireless router.
- **Ad hoc** – Directly connecting to another computer for peer-to-peer communication using wireless network adapters on each computer, such as two or more DWR-961 wireless network CardBus adapters.

An Infrastructure network contains an access point or wireless router. All the wireless devices, or clients, will connect to the wireless router or access point.

An ad hoc network contains only clients, such as laptops with wireless CardBus adapters. All the adapters must be in ad hoc mode to communicate.

Networking Basics

Check your IP address

After you install your new D-Link adapter, by default, the TCP/IP settings should be set to obtain an IP address from a DHCP server (i.e. wireless router) automatically. To verify your IP address, please follow the steps below.

Click on **Start** > **Run**. In the run box type **cmd** and click **OK**. (Windows® 7/Vista® users type **cmd** in the **Start Search** box.)

At the prompt, type **ipconfig** and press **Enter**.

This will display the IP address, subnet mask, and the default gateway of your adapter.

If the address is 0.0.0.0, check your adapter installation, security settings, and the settings on your router. Some firewall software programs may block a DHCP request on newly installed adapters.

```
C:\WINDOWS\system32\cmd.exe
Microsoft Windows XP [Version 5.1.2600]
(C) Copyright 1985-2001 Microsoft Corp.

C:\Documents and Settings>ipconfig

Windows IP Configuration

Ethernet adapter Local Area Connection:

    Connection-specific DNS Suffix  . : dlink
    IP Address. . . . .               : 10.5.7.114
    Subnet Mask . . . . .             : 255.255.255.0
    Default Gateway . . . . .         : 10.5.7.1

C:\Documents and Settings>
```

Statically Assign an IP address

If you are not using a DHCP capable gateway/router, or you need to assign a static IP address, please follow the steps below:

Step 1

Windows® 7 - Click on **Start > Control Panel > Network and Internet > Network and Sharing Center**.

Windows Vista® - Click on **Start > Control Panel > Network and Internet > Network and Sharing Center > Manage Network Connections**.

Windows® XP - Click on **Start > Control Panel > Network Connections**.

Windows® 2000 - From the desktop, right-click **My Network Places > Properties**.

Step 2

Right-click on the **Local Area Connection** which represents your network adapter and select **Properties**.

Step 3

Highlight **Internet Protocol Version 4 (TCP/IPv4)** and click **Properties**.

Step 4

Click **Use the following IP address** and enter an IP address that is on the same subnet as your network or the LAN IP address on your router.

Example: If the router's LAN IP address is 192.168.0.1, make your IP address 192.168.1.X where X is a number between 2 and 99. Make sure that the number you choose is not in use on the network. Set the Default Gateway the same as the LAN IP address of your router (I.E. 192.168.0.1).

Set Primary DNS the same as the LAN IP address of your router (192.168.0.1). The Alternate DNS is not needed or you may enter a DNS server from your ISP.

Step 5

Click **OK** twice to save your settings.

Wireless Security

This section will show you the different levels of security you can use to protect your data from intruders. The DWR-961 offers the following types of security:

- WPA2 (Wi-Fi Protected Access 2)
- WPA (Wi-Fi Protected Access)
- WPA2-PSK (Pre-Shared Key)
- WPA-PSK (Pre-Shared Key)

What is WPA?

WPA (Wi-Fi Protected Access), is a Wi-Fi standard that was designed to improve the security features of WEP (Wired Equivalent Privacy).

The 2 major improvements over WEP:

- Improved data encryption through the Temporal Key Integrity Protocol (TKIP). TKIP scrambles the keys using a hashing algorithm and by adding an integrity-checking feature, ensures that the keys haven't been tampered with. WPA2 is based on 802.11i and uses Advanced Encryption Standard (AES) instead of TKIP.
- User authentication, which is generally missing in WEP, through the extensible authentication protocol (EAP). WEP regulates access to a wireless network based on a computer's hardware-specific MAC address, which is relatively simple to be sniffed out and stolen. EAP is built on a more secure public-key encryption system to ensure that only authorized network users can access the network.

WPA-PSK/WPA2-PSK uses a passphrase or key to authenticate your wireless connection. The key is an alpha-numeric password between 8 and 63 characters long. The password can include symbols (!?*&_) and spaces. This key must be the exact same key entered on your wireless router or access point.

WPA/WPA2 incorporates user authentication through the Extensible Authentication Protocol (EAP). EAP is built on a more secure public key encryption system to ensure that only authorized network users can access the network.

Technical Specifications

LTE Band¹

- Category 6: Band 2/4/5/12/13/25/26/41

Data Rates²

- Up to 866.7 Mbps with 802.11ac clients
- 6 / 9 / 11 / 12 / 18 / 24 / 36 / 48 / 54 Mbps in 802.11g mode
- 1 / 2 / 5.5 / 11 Mbps in 802.11b mode
- LTE Uplink: Up to 50 Mbps
- LTE Downlink: Up to 100 Mbps

Standards

- IEEE 802.11b/g, compatible with IEEE 802.11n/ac devices
- IEEE 802.3i
- IEEE 802.3u

Wireless Security

- 64 / 128-bit WEP (Wired Equivalent Privacy)
- WPA & WPA2 (Wi-Fi Protected Access)

Firewall

- Network Address Translation (NAT)
- Stateful Packet Inspection (SPI)

VPN

- L2TP/PPTP/IPSEC/VPN Pass-through

Antenna

- Two detachable 4G antennas

Ports

- Four LAN ports (RJ-45)
- WAN port (RJ-45)

SIM/UICC Slot

- Standard Mini-SIM/UICC slot

LED Status Indicators

- Power
- Internet
- 5GHz
- 2.4GHz
- 4G
- LAN/ WAN/ Signal Strength

Dimensions

- 170 x 180 x 80 mm

Operating Temperature

- 0 to 40 °C (32 to 104 °F)

Operating Humidity

- 10% to 90% (Non-condensing)

Certifications

- FCC
- RoHS

¹ Supported frequency band is dependent upon regional hardware version.

² Maximum wireless signal rate derived from IEEE Standard 802.11g/b/n/ac specifications. Actual data throughput will vary. Network conditions and environmental factors, including volume of network traffic, building materials and construction, and network overhead, lower actual data throughput rate. Environmental factors will adversely affect wireless signal range.

Regulatory Information

Federal Communication Commission Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Non-modifications Statement:

Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.

Caution:

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

- (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

For product available in the USA/Canada market, only channel 1~11 can be operated. Selection of other channels is not possible.

Note

The country code selection is for non-USA models only and is not available to all USA models. Per FCC regulations, all WiFi product marketed in the USA must be fixed to USA operational channels only.

IMPORTANT NOTICE:

FCC Radiation Exposure Statement

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20 cm between the radiator and your body.
