

# ENGINEERING TEST REPORT

## **Point of Sale Device Model No.: NURIT 8000 RIM**

### **Tested For**

**Lipman USA, Inc.**  
50 Gordon Dr.  
Syosset, NY  
USA, 11791

### ***In Accordance With***

**SAR (Specific Absorption Rate) Requirements  
using guidelines established in IEEE C95.1-1991,  
FCC OET Bulletin 65 (Supplement C),  
Industry Canada RSS-102(Issue 1) and  
ACA Radiocommunications (Electromagnetic Radiation – Human Exposure)  
Amendment Standard 2000 (No. 1)**

**UltraTech's File No.: LIP-011-SAR**

This Test report is Issued under the Authority of  
Tri M. Luu, Professional Engineer,  
Vice President of Engineering  
UltraTech Group of Labs

Date: February 22, 2002

Report Prepared by: JaeWook Choi

Tested by: JaeWook Choi

Issued Date: February 22, 2002

Test Dates: February 3, 2002

*The results in this Test Report apply only to the sample(s) tested, which has been randomly selected.*

## EXHIBIT 1. INTRODUCTION

### 1.1. SCOPE

<b>Reference:</b>	SAR (Specific Absorption Rate) Requirements IEEE C95.1-1991, FCC OET Bulletin 65 (Supplement C) Industry Canada RSS-102 (Issue 1). ACA Radiocommunications (Electromagnetic Radiation – Human Exposure), Amendment Standard 2000 (No. 1)
<b>Title</b>	Safety Levels with respect to human exposure to Radio Frequency Electromagnetic Fields Guideline for Evaluating the Environmental Effects of Radio Frequency Radiation
<b>Purpose of Test:</b>	To verify compliance with Federal regulated SAR requirements in Canada and the US.
<b>Method of Measurements:</b>	IEEE C95.1-1991, FCC OET Bulletin 65 (Supplement C) and Industry Canada RSS-102(Issue 1)
<b>Exposure Category</b>	[X] General population, uncontrolled exposure [ ] occupational, controlled exposure

### 1.2. REFERENCES

The methods and procedures used for the measurements contained in this report are details in the following reference standards:

Publications	Year	Title
IEEE Std. 1528-2001 Draft	2001	Draft Recommended practice for determining the Peak Spatial-Average Specific Absorption rate (SAR) in the Human Body Due to Wireless Communications Devices: Experimental Techniques.
Industry Canada RSS102	1999	"Evaluation Procedure for Mobile and Portable Radio Transmitters with respect to Health Canada's Safety Code 6 for Exposure of Humans to Radio Frequency Fields"
ACA	2000	ACA Radiocommunications (Electromagnetic Radiation – Human Exposure) Amendment Standard 2000 (No. 1)
NCRP Report No.86	1986	"Biological Effects and Exposure Criteria for radio Frequency Electromagnetic Fields"
FCC OET Bulletin 65	1997	"Evaluating Compliance with FCC Guidelines for Human Exposure to radio Frequency Fields"
ANSI/IEEE C95.3	1992	"Recommended Practice for the Measurement of Potentially Hazardous Electromagnetic Fields - RF and Microwave"
ANSI/IEEE C95.1	1992	"Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3kHz to 300GHz"
AS/NZS 2722.1	1998	Interim Australian/New Zealand Standard. "Radiofrequency fields, Part 1:Maximum exposure levels – 3kHz to 300GHz "

## EXHIBIT 2. PERFORMANCE ASSESSMENT

### 2.1. CLIENT AND MANUFACTURER INFORMATION

<b>APPLICANT:</b>	
<b>Name:</b>	Lipman USA, Inc.
<b>Address:</b>	50 Gorgon Dr. Syosset, NY USA, 11791
<b>Contact Person:</b>	Mr. John Carpino Phone #: +1 516 484 9898

<b>MANUFACTURER:</b>	
<b>Name:</b>	Lipman Electronic Engineering, Ltd.
<b>Address:</b>	11 Haamal St Park Afek Rosh Haayin 48092 Israel
<b>Contact Person:</b>	Amit Chhabra Phone #: +1 800 454 7626 ext. 2300 +1 516 484 9898 ext. 2300

### 2.2. DEVICE UNDER TEST (DUT) DESCRIPTION

The following is the information provided by the applicant.

<b>Trade Name</b>	Point of Sale Device
<b>Type/Model Number</b>	NURIT 8000 RIM
<b>Serial Number</b>	Test Sample
<b>Type of Equipment</b>	Licensed Non-Broadcast Station Transmitter
<b>Frequency of Operation</b>	896 – 901 MHz
<b>Rated RF Power</b>	2 W (conducted)
<b>Modulation Employed</b>	FM data
<b>Emissions Designation</b>	12K8F1D
<b>Antenna Type</b>	Patch
<b>External Power Supply</b>	Lipman USA inc., Power Supply/Charger Model No.: TRF00050
<b>Primary User Functions of DUT:</b>	Wireless hand held POS/EDC terminal for credit, debit and ERT transactions

Tel. #: 905-829-1570, Fax. #: 905-829-8050, Email: [yhk.ultratech@sympatico.ca](mailto:yhk.ultratech@sympatico.ca), Website: <http://www.ultratech-labs.com>

File #: LIP-011-SAR

February 22, 2002

- Assessed by ITI (UK) Competent Body, NVLAP (USA) Accreditation Body & ACA/AUSTEL (Australia), VCCI (Japan)
- Accredited by Industry Canada (Canada) under ACC-LAB (Europe/Canada MRA and APEC/Canada MRA)
- Recognized/Listed by FCC (USA)
- All test results contained in this engineering test report are traceable to National Institute of Standards and Technology (NIST)

**2.3. LIST OF DUT'S ACCESSORIES:**

Lipman USA Inc., Power Supply/Charger, Model No.: TRF00050

**2.4. SPECIAL CHANGES ON THE DUT'S HARDWARE/SOFTWARE FOR TESTING PURPOSES**

N/A

**2.5. ANCILLARY EQUIPMENT**

IBM Laptop, Type 2625-DEF, Serial No. 78-WWM48 96/05

**2.6. GENERAL TEST CONFIGURATIONS****2.6.1. Equipment Configuration**

Power and signal distribution, grounding, interconnecting cabling and physical placement of equipment of a test system shall simulate the typical application and usage in so far as is practicable, and shall be in accordance with the relevant product specifications of the manufacturer.

The configuration that tends to maximize the DUT's emission or minimize its immunity is not usually intuitively obvious and in most instances selection will involve some trial and error testing. For example, interface cables may be moved or equipment re-orientated during initial stages of testing and the effects on the results observed.

Only configurations within the range of positions likely to occur in normal use need to be considered.

The configuration selected shall be fully detailed and documented in the test report, together with the justification for selecting that particular configuration.

**2.6.2. Exercising Equipment**

The exercising equipment and other auxiliary equipment shall be sufficiently decoupled from the EUT so that the performance of such equipment does not significantly influence the test results.

**2.7. SPECIFIC OPERATING CONDITIONS**

1. EUT will not transmit without connecting the RS232C cable at the back of EUT by its nature at the moment. Therefore the evaluation was performed with RS232C cable connected and the other end of cable connected to the laptop for control.
2. EUT will transmit only a few seconds with 100% duty cycle, then shut down itself automatically. So EUT was configured to transmit the signal with **25% duty cycle** since it is limited on the network the radio modem is designed to be used in.

**ULTRATECH GROUP OF LABS**

3000 Bristol Circle, Oakville, Ontario, Canada L6H 6G4

Tel. #: 905-829-1570, Fax. #: 905-829-8050, Email: [yhk.ultratech@sympatico.ca](mailto:yhk.ultratech@sympatico.ca), Website: <http://www.ultratech-labs.com>

**File #: LIP-011-SAR**

**February 22, 2002**

- Assessed by ITI (UK) Competent Body, NVLAP (USA) Accreditation Body & ACA/AUSTEL (Australia), VCCI (Japan)
- Accredited by Industry Canada (Canada) under ACC-LAB (Europe/Canada MRA and APEC/Canada MRA)
- Recognized/Listed by FCC (USA)
- All test results contained in this engineering test report are traceable to National Institute of Standards and Technology (NIST)

## 2.8. BLOCK DIAGRAM OF TEST SETUP

The EUT was configured as normal intended use. The following block diagram shows a representative equipment arrangement during tests:

### ULTRATECH GROUP OF LABS

3000 Bristol Circle, Oakville, Ontario, Canada L6H 6G4

Tel. #: 905-829-1570, Fax. #: 905-829-8050, Email: [yhk.ultratech@sympatico.ca](mailto:yhk.ultratech@sympatico.ca), Website: <http://www.ultratech-labs.com>**File #: LIP-011-SAR****February 22, 2002**

- Assessed by ITI (UK) Competent Body, NVLAP (USA) Accreditation Body & ACA/AUSTEL (Australia), VCCI (Japan)
- Accredited by Industry Canada (Canada) under ACC-LAB (Europe/Canada MRA and APEC/Canada MRA)
- Recognized/Listed by FCC (USA)
- All test results contained in this engineering test report are traceable to National Institute of Standards and Technology (NIST)

## EXHIBIT 3. SUMMARY OF TEST RESULTS

### 3.1. LOCATION OF TESTS

All of the measurements described in this report were performed at UltraTech Group of Labs located at:

3000 Bristol Circle, in the city of Oakville, Province of Ontario, Canada.

All measurements were performed in UltraTech's shielded chamber, 24' x 16' x 8'.

### 3.2. APPLICABILITY & SUMMARY OF SAR RESULTS

The peak spatial - average SAR measured was found to be **1.459 W/Kg** at **25 mm separation** with **25 % duty cycle** (32 ms : 96 ms)

SAR Limits	Test Requirements	Compliance (Yes/No)
<b>General population/Uncontrolled exposure</b>  0.08W/kg whole body average and spatial peak SAR of 1.6W/kg, averaged over 1gram of tissue Hands, wrist, feet and ankles have a peak SAR not to exceed 4 W/kg, averaged over 10 grams of tissue.	Requirements using guidelines established in IEEE C95.1-1991  FCC OET Bulletin 65 (Supplement C)  Industry Canada RSS-102 (Issue 1).  ACA Radiocommunications (Electromagnetic Radiation – Human Exposure) Amendment Standard 2000 (No. 1)	YES
<b>Occupational/Controlled Exposure</b>  0.4W/kg whole body average and spatial peak SAR of 8W/kg, averaged over 1gram of tissue Hands, wrist, feet and ankles have a peak SAR not to exceed 20 W/kg, averaged over 10 grams of tissue.	Requirements using guidelines established in IEEE C95.1-1991  FCC OET Bulletin 65 (Supplement C),  Industry Canada RSS-102 (Issue 1)  ACA Radiocommunications (Electromagnetic Radiation – Human Exposure) Amendment Standard 2000 (No. 1)	N/A

**EXHIBIT 4. MEASUREMENTS, EXAMINATIONS & TEST DATA****4.1. TEST SETUP**

EUT Information		Condition	
Radio Type	Point of Sale Device	Robot Type	6 Axis
Model Number	NURIT 8000 RIM	Scan Type	SAR - Area/Zoom
Serial Number	Test Sample	Measured Field	E
Frequency Band (MHz)	896 – 901	Phantom Type	2mm base Flat Phantom
Frequency Tested (MHz)	896, 901	Phantom Position	Waist
Nominal Output Power (W)	2 W Conducted	Room Temperature	22 °C ± 1 °C
Antenna Type	Integrated PCB mount	Room Humidity	35 % ± 10 %
Signal Type	FM	Tissue Temperature	22 °C ± 1 °C
Duty Cycle	25% (32 ms : 96 ms)		

Type of Tissue	Muscle
Target Frequency (MHz)	915
Target Dielectric Constant	55.0 ± 5%
Target Conductivity (S/m)	1.06 ± 5%
Composition (by weight)	DI Water (53.13 %) Sugar (45.62 %) Salt (0.93%) HEC (0.23 %) Bactericide (0.01%)
Measured Dielectric Constant	54.02
Measured Conductivity (S/m)	1.03
Probe Name	E
Probe Orientation	Isotropic
Probe Offset (mm)	2.25
Sensor Factor	10.8
Conversion Factor	1.0185
Calibration Date (MM/DD/YY)	01/31/2002

#### 4.4. MAXIMUM FIELD LOCATION (BODY)

The maximum field was found to be located at (0, 0) with the test configuration as described below:

- Body-worn position
- The Back of EUT in contact with the phantom
- 896 MHz
- 25 mm separation
- 25 % duty cycle

Complete area Pre-scans on all faces of the EUT were conducted to determine the location of the highest SAR and the device was repositioned to allow the identified hot-spots to be orientated with as large an area around the hot-spots to come into contact with the phantom surface. This procedure ensured that the maximum SAR readings would be obtained from the hot-spot areas identified.

## EXHIBIT 5. SAR SYSTEM CONFIGURATION & TEST METHODOLOGY

### 5.1. MEASUREMENT SYSTEM SPECIFICATIONS

Positioning Equipment	Probe
Type : 3D Near Field Scanner	Sensor : E-Field
Location Repeatability : 0.1mm	Spatial Resolution : 0.1 cm <sup>3</sup>
Speed 180 °/sec	Isotropic Response : ± 0.25 dB
AC motors	Dynamic Range : 2 µW/g to 100 mW/g
Computer	Phantom
Type : Pentium III 500MHz	Tissue : Simulated Tissue with electrical characteristics similar to those of the human at normal body temperature.
Memory : 256 MB RAM	Left/Right Head: IEEE P1528 Compliant SAM manufactured by Aprel
Operating System : Windows 2000 Pro	Body/Frontal Head: IEEE Flat Phantom 2mm Base
Monitor : 19" SVGA	

### 5.2. TEST PROCEDURES

In the SAR measurement, the positioning of the probes must be performed with sufficient accuracy to obtain repeatable measurements in the presence of rapid spatial attenuation phenomena. The accurate positioning of the E-field probe is accomplished by using a high precision robot. The robot can be taught to position the probe sensor following a specific pattern of points. In a first sweep, the sensor is positioned as close as possible to the interface, with the sensor enclosure touching the inside of the fiberglass shell. The SAR is measured on a grid of points, which covers the curved surface of the phantom in an area larger than the size of the DUT. After the initial scan, a high-resolution grid is used to locate the absolute maximum measured energy point. At this location, attenuation versus depth scan will be accomplished by the measurement system to calculate the SAR value.

### 5.3. PHANTOM

For Head mounted devices placed next to the ear, the phantom used in the evaluation of the RF exposure of the user of the wireless device is a IEEE P1528 compliant SAM phantom, shaped like a human head and filled with a mixture simulating the dielectric characteristics of the brain. A left sided head and a right sided head are evaluated to determine the worst case orientation for SAR. For body mounted and frontal held push-to-talk devices, a flat phantom of dimensions 70x42x20cm with a base plate thickness of 2mm is used.

## 5.4. SIMULATED TISSUE

Simulated Tissue: Suggested in a paper by George Hartsgrrove and colleagues in University of Ottawa Ref.: Bioelectromagnetics 8:29-36 (1987)

Ingredient	Quantity
Water	40.4 %
Sugar	56.0 %
Salt	2.5 %
HEC	1.0 %
Bactericide	0.1 %

Table. Example of composition of simulated tissue.

This simulated tissue is mainly composed of water, sugar and salt. At higher frequencies, in order to achieve the proper conductivity, the solution does not contain salt. Also, at these frequencies, D.I. water and alcohol is preferred.

Target Frequency	Head		Body	
(MHz)	$\epsilon_r$	$\sigma$ (S/m)	$\epsilon_r$	$\sigma$ (S/m)
150	52.3	0.76	61.9	0.80
300	45.3	0.87	58.2	0.92
450	43.5	0.87	56.7	0.94
835	41.5	0.90	55.2	0.97
900	41.5	0.97	55.0	1.05
915	41.5	0.98	55.0	1.06
1450	40.5	1.20	54.0	1.30
1610	40.3	1.29	53.8	1.40
1800 – 2000	40.0	1.40	53.3	1.52
2450	39.2	1.80	52.7	1.95
3000	38.5	2.40	52.0	2.73
5800	35.3	5.27	48.2	6.00

( $\epsilon_r$  = relative permittivity,  $\sigma$  = conductivity and  $\rho = 1000 \text{ kg/m}^3$ )

- All test results contained in this engineering test report are traceable to National Institute of Standards and Technology (NIST)

Tissue Density : Approximately 1.25 g/cm<sup>3</sup>

#### **5.4.1. Preparation**

We determine the volume needs and carefully measure all components. A clean container is used where the ingredients will be mixed. A stirring paddle mounted to a drill press is used to stir the mixture. First we heat the DI water to about 40 °C to help the ingredients dissolve and then we pour the salt and the bactericide. We stir until all the ingredients are completely dissolved. We continue stirring slowly while adding the sugar. We avoid high RPM from the mixing device to prevent air bubbles in the mixture. Later on, we add the HEC to maintain the solution homogeneous. Mixing time is approximately 30 to 40 min.

### **5.5. MEASUREMENT OF ELECTRICAL CHARACTERISTICS OF SIMULATED TISSUE**

- 1)** Network Analyzer HP8753C or others
- 2)** Slotted Coaxial Waveguide

#### **5.5.1. Description of the slotted coaxial waveguide**

The cylindrical waveguide is constructed with copper tube of about 30 to 40 cm in length, generally 12.5 mm diameter, with connectors at both ends. Inside of this tube, a conductive rod about 6.3 mm is coaxial supported by the two ends connectors (radiator). A slot 3 mm wide start at the beginning of the tube to approximately two thirds of the tube length. The outer edge of the slotted tube is marked in increments of 1 centimeter (10 to 12), and 0.5 centimeter for higher frequencies. A saddle piece containing the sampling probe is inserted in the slot so the tip of the probe is close but not in contact with the inner conductor (radiator).

To measure the electrical characteristics of the liquid simulated tissue, we fill the coaxial waveguide with the mixture, select CW frequency and measure amplitude and phase with the Network Analyzer for every point in the slot (typically 11). An effort is made to keep the resultant dielectric constant and conductivity within 5 % of published data.

- Assessed by ITI (UK) Competent Body, NVLAP (USA) Accreditation Body & ACA/AUSTEL (Australia), VCCI (Japan)

- Recognized/Listed by FCC (USA )
- *All test results contained in this engineering test report are traceable to National Institute of Standards and Technology (NIST)*

## Electrical Characteristics Measurement Setup

$$c = 3 \cdot 10^8 \text{ m/s}$$

$$A = \frac{\Delta A}{20} \ln_{10} \frac{1}{m}$$

$$\theta = \frac{\Delta \theta \cdot 2\pi}{360}$$

$$\lambda = \frac{c}{f} \cdot \frac{100}{2.54} \text{ inches}$$

$$\epsilon_{re} = \frac{(A^2 + \theta^2) \cdot \lambda^2}{4\pi^2}$$

$$\theta' = \left| \frac{|A| \cdot \lambda}{4\pi \sqrt{\epsilon_{re}}} \right|$$

$$S = \tan(2\theta')$$

$$\epsilon_r = \frac{\epsilon_{re}}{\sqrt{(1 + S^2)}}$$

$$\sigma = S \cdot 2\pi \cdot f \cdot 8.854 \cdot 10^{12} \cdot \epsilon_r \text{ (S/m)}$$

where;

$\Delta A$  is the amplitude attenuation in dB

$\Delta \theta$  is the phase change in degrees for 5 cm of wave propagation in the slotted line

$f$  is the frequency of interest in Hz.

## 5.6. SYSTEM DESCRIPTION

The measurement system consists of an E-field probe, instrumentation amplifiers, RF transparent cable connecting the amplifiers to the computer, the robotics arm with its extension and proximity sensors, a phantom with simulated tissue and a radio holder to support the device under test. The E-field probe is a three channel device used to measure RF electric fields in the near vicinity of the source. The three sensors are mutually orthogonal positioned dipoles, and are constructed over a quartz substrate. Located in the center of the dipole is a Schottky diode. High impedance lines are connecting the sensor to the amplifier and then optically linked to the computer. The probe has an isotropic response and is transparent to the RF fields.

Calibration is performed by two steps:

- 1) Determination of free space E-field from amplified probe outputs in a test RF field. This calibration is performed in a TEM cell when the frequency is below 1 GHz and in a waveguide or some other methodologies above 1 GHz. For the free space calibration, we place the probe in the volumetric center of the cavity and at the proper orientation with the field. The probe is then rotated 360 degrees until the three channels show the maximum reading. This reading equate to  $1\text{mW}/\text{cm}^2$  if that power density is available in the correspondent cavity.
- 2) Correlation of the measured free space E-field, to temperature rise in a dielectric medium. E-field temperature correlation calibration is performed in a planar phantom filled with the appropriate simulated tissue.

For temperature correlation calibration, a RF transparent thermistor-based temperature probe is used in conjunction with the E-field probe. First, the location of the maximum E-field close to the phantom's inner surface is determined as a function of power into the RF source; in this case, a dipole. Then, the E-field probe is moved sideways so that the temperature probe, while affixed to the E-field probe is placed at the previous location of the E-field probe. Finally, temperature changes for 30 seconds exposure at the same RF power levels used for the E-field measurement are recorded. The following equation relates SAR to initial temperature slope:

$$SAR = C \frac{\Delta T}{\Delta t}$$

where:

$\Delta t$  = exposure time (30 seconds),  
 $C$  = heat capacity of tissue,  
 $\Delta T$  = temperature increase due to RF exposure.

SAR is proportional to  $T/t$ , the initial rate of tissue heating, before thermal diffusion takes place. Now, it's possible to quantify the electric field in the simulated tissue by equating the thermally derived SAR to the E-field;

$$SAR = \frac{|E|^2 \cdot \sigma}{\rho}$$

where:

$\sigma$  = Simulated tissue conductivity,  
 $\rho$  = Mass density of solution

## 5.7. DATA EXTRAPOLATION (CURVE FITTING)

The distance from the center of the sensor (diode) to the end of the protective tube is called the ‘probe offset’. To compensate we use an exponential curve fitting method to obtain the peak surface value from the voltages measured at the distance from the inner surface of the phantom. At the point where the highest voltage was recorded, the field is measured as close as possible to the phantom’s surface and every 1mm along the ‘Z’ axis for a distance of 50 mm. The appropriate exponential curve is obtained from all the points measured and used to define an exponential decay of the energy density versus depth.

$$E(z) = E_0 \cdot e^{-z/\delta} \text{ (mV)}$$

## 5.8. INTERPOLATION AND GRAM AVERAGING

The voltage, (1 cm) above the phantoms surface ( $E_{\text{tot}} 1 \text{ cm}$ ), is needed to calculate the exposure over one gram of tissue. This SAR value that estimates the average over 1 gram of tissue, is obtained by taking the integral over 1  $\text{cm}^2$  surface of the measured field along the exponential decay curve of the energy density with depth.

$$SAR(mW/g) = \int_{v=1g} SAR(\bullet) dv = \int_{s=1\text{cm}^2} \int_0^{1\text{cm}} E(z) \cdot \frac{CF}{\text{SensorFactor}} dz ds$$

## 5.9. POWER MEASUREMENT

Whenever possible, a conducted power measurement is performed. To accomplish this, we utilize a fully charged battery, a calibrated power meter and a cable adapter provided by the manufacturer. The data of the cable and related circuit losses are also provided by the manufacturer. The power measurement is then performed across the operational band and the channel with the highest output power is recorded.

Power measurement is performed before and after the SAR to verify if the battery was delivering full power at the time of testing. A difference in output power would determine a need for battery replacement and to repeat the SAR test.

Measured Power + Cable and Switching Mechanism Loss

## 5.10. POSITIONING OF D.U.T.

The clear SAM phantom shell have been previously marked with a highly visible grid with a defined centre line, so it can easily be seen through the liquid simulated tissue. In the case of testing a cellular phone, this line is connecting the ear channel with the corner of the lips. The D.U.T. is then placed by centering the speaker with the ear channel and the center of the radio width with the corner of the mouth.

For HAND HELD devices (push-to-talk), or any other type of wireless transmitters positioned in front of the face, the D.U.T. will be positioned 2.5cm distance from a flat phantom to simulate the frontal facial position in use. All body-worn operating configurations are tested using a flat phantom. The length and width of the phantom is at least twice the corresponding dimensions of the test device, including its antenna.

**Figure 5.1 – Side view of the phantom showing relevant marking**

## 5.11. SAR MEASUREMENT UNCERTAINTY

This uncertainty analysis covers the 3D-EMC Laboratory test procedure for Specific Absorption Rate (SAR) associated with wireless telephones and similar devices.

### Standards Covered Are:

WGMTE 96/4 - Secretary SC211/B

FCC 96-326, ET Docket No. 93-62

Industry Canada RSS 102

ACA Radiocommunications (Electromagnetic Radiation – Human Exposure) Amendment Standard 2000 (No. 1)

The laboratory test procedure, and this uncertainty analysis, may be used to cover all standards above. It is based on test equipment and procedures specified by 3D-EMC Laboratories, Inc. located in Ft. Lauderdale, Florida.

### Measurement Uncertainty:

Table I. Estimated SAR Measurement Uncertainty

Contribution	Error (±dB)	Probability Distribution	Type Evaluation	Standard Uncertainty (±dB)
A. Field Measurement Errors:		Rectangular	Type B	
Isotropy in Phantom BTS Liquid	0.8			0.46
Frequency Response	0.2			0.12
Linearity	0.2			0.12
Probe Calibration Error (rss)	0.7			0.40
Duty Factor Variability	0.2			0.12
B. Spatial Peak SAR Errors:		Normal	Type A	
Extrapolation & Interpolation, and Position	0.2			0.20
Integration & Search Routine	0.1			0.10
Cube Shape	0.2			0.20
C. Additional Errors:		Rectangular	Type B	
Solution Variability (Worst-Case SAR)	0.21			0.12
D. Combined Standard Uncertainty, $u_c$ :		Normal	-	0.52
E. Expanded Uncertainty, $U$ :		Normal (k=2)	-	1.04
		95% Confidence	-	27.14%

## EXHIBIT 6. SAR PRESCANS

### Precans to determine the worst configuration of RF exposure:

#### (1) Body-worn configurations

EUT Configurations	Antenna Position	SAR (W/kg) Device Test Frequency
		896 MHz
Back face in contact with phantom, 25% duty cycle	Internal	10.121
Front face in contact with phantom, 25% duty cycle	Internal	1.351
Left face in contact with phantom, 25% duty cycle	Internal	2.422
Right face in contact with phantom, 25% duty cycle	Internal	0.903

Precans for the feasible configurations had been performed in order to determine the worst case under the specific configurations as described in the table. Through these prescans, the hot spot was found to be located at the vicinity of the base of the antenna. The test configurations in which a failure was found, were re-evaluated by increasing the separation distance until it was compliant with FCC limit.

- Recognized/Listed by FCC (USA )
- All test results contained in this engineering test report are traceable to National Institute of Standards and Technology (NIST)

Probe Name : UT-ETR-0200-1  
Type : E-field (Triangular beam), Offset(mm) : 2.25  
Frequency(MHz) : 900  
Amplifier Setting : 0.00560845, 0.00534653, 0.00665982  
Calibrated Date : 01/02/2002 1:31:59 PM

Probe Name : UT-ETR-0200-1  
Type : E-field (Triangular beam), Offset(mm) : 2.25  
Frequency(MHz) : 915, Conversion Factor : 1.0185  
Simulated Tissue Type : Muscle  
Dielectrical Const. : 54.0, Conductivity : 1.03  
Temperature - Simulated Tissue : 22.3°C, Room : 22.0°C  
Calibrated Date : 31/01/2002 6:30:50 PM

# E-Field & Diode Compensation

## EXHIBIT 11. SYSTEM VALIDATION

The system was verified in the flat phantom (2.0mm  $\pm$  0.2mm base thickness) using 835MHz dipole validation kit(M/N: 3125-870 S/N:1008) manufactured by EMCO. A forward power of 1.0 W was fed to the dipole and the distance between the dipole axis and the liquid were 15mm as specified in IEEE Standards 1528.

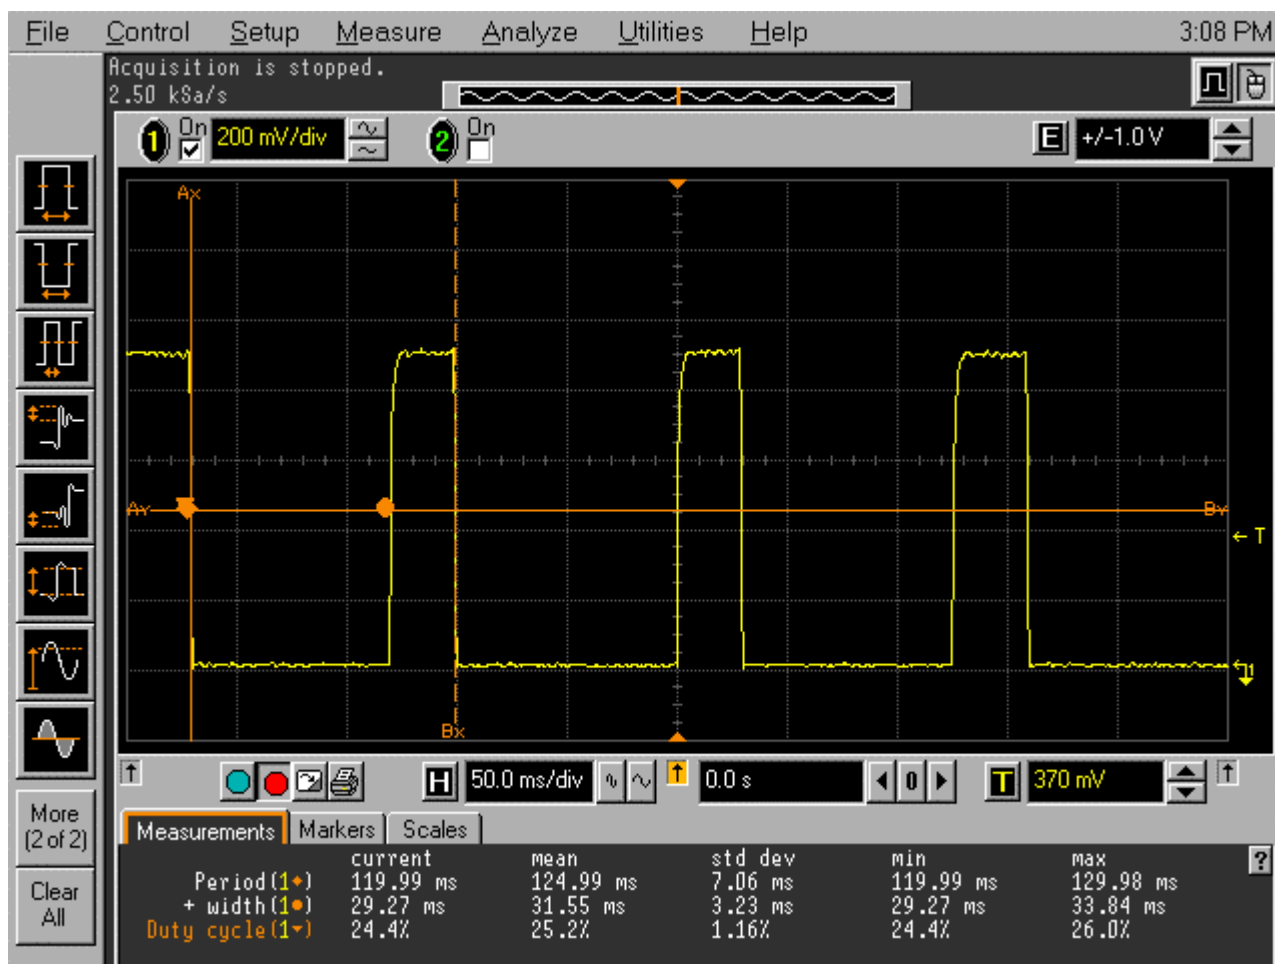

Validation Kit	Target SAR (W/Kg) over 1g volume	SAR (W/Kg) over 1g volume
EMCO M/N:3125-870	9.5	9.719

**EXHIBIT 12. DUTY CYCLE INFORMATION**

$$\text{Duty Cycle} = 32 \text{ ms} / (96 + 32) \text{ ms} \times 100 \cong 25\%$$

The Crest Factor is a parameter which describes the SAR systems ability to measure signals that have various peak to RMS ratios while still remaining within the system specifications. The crest factor is not provided for the 3D-EMC system and a verification test was carried out to determine that the SAR system is responding to the duty cycle waveform as an averaging system. A uniform field within a TEM cell is used to compare the output of the SAR system of a CW signal at the frequency of interest, with a pulse modulated carrier using the same pulse width and repetition rate as the Lipman POS previously tested at 25%. An HP 437A Peak power meter is used to set the same peak power in both test conditions. The 3D-EMC system allows for a real-time monitoring of all amplifier channels. The summed output of the three amplifier channels from the probe is directly proportional to the  $E^2$  which is also directly proportional to SAR according to the equation:

$$SAR = \frac{\sigma E^2}{\rho}$$

The measured results from the monitor are:

SAR System Output for CW = 26.422

SAR System Output for 25% = 6.596

The ratio of the CW to Duty Cycle Field =  $6.596/26.422 \times 100\% = 24.96\%$

The above test verifies that the SAR system is correctly averaging the pulsed carrier and that the measured SAR values are time based average values.

Figure 1. Amplifier channel real-time output monitor of SAR system for a CW signal

Figure 2. Amplifier channel real-time output monitor of SAR system for a 25% Pulse modulated Signal
