Model Number	WSD-F21	WSD-F21
Serial Number	6	6
Condition of EUT	Production prototype *. Not for sale: These samples are equivalent to mass-produced items.	Production prototype
Receipt Date of Sample	February 4, 2019 (*. EUT for power measurement.) *. No modification by the Lab. March 1, 2019 (*. EUT for SAR test.) *. No modification by the Lab. (* After power measurement, the EUT was returned to the customer, and the RF wiring was changed to the original antenna line from the antenna conducted power measurement line by the customer.)	
Country of Mass-production	Japan, Thailand	
Category Identified	Portable device	
Feature of EUT	Model: WSD-F21 (referred to as the EUT in this report) is a RF Module which installs into the Smart Outdoor Watch (Wristwatch, Model: WSD-F21). The platform: WSD-F21 supports some operations and functions (e.g. responding to mail and SMS messages, etc.) by using the voice command.	
SAR Accessory (Platform)	Removable wrist band: non-metallic. *. For the SAR test, the wrist band holder was cut off and also removed the wrist band to make the back of wristwatch touch to the flat phantom directly. (Refer to Appendix 1-1 for more detail.)

*. The EUT do not use the special transmitting technique such as "beam-forming" and "time-space code diversity."

*. Since Wi-Fi and Bluetooth are used a same antenna, Wi-Fi and Bluetooth do not transmit simultaneously.

SECTION 3: Test specification, procedures and results

3.1 Test specification

FCC47CFR 2.1093: Radiofrequency radiation exposure evaluation: portable devices.

The US Federal Communications Commission has released the report and order "Guidelines for Evaluating the Environmental Effects of RF Radiation", ET Docket No. 93-62 in August 1996. The order requires routine SAR evaluation prior to equipment authorization of portable transmitter devices, including portable telephones. For consumer products, the applicable limit is 1.6 mW/g for an uncontrolled environment and 8.0 mW/g for an occupational/controlled environment as recommended by the ANSI/IEEE standard C95.1-1992. The device should be evaluated at maximum output power (radiated from the antenna) under "worst-case" conditions for normal or intended use, incorporating normal antenna operating positions, device peak performance frequencies and positions for maximum RF energy coupling in accordance with the following measurement procedures.

KDB 447498 D01 (v06): General RF exposure guidance
KDB 248227 D01 (v02r02): SAR Guidance for IEEE 802.11 (Wi-Fi) transmitters
KDB 865664 D01 (v01r04): SAR measurement 100MHz to 6GHz
IEEE Std. 1528-2013: IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques.

3.2 Exposure limit

Environments of exposure limit	Whole-Body (averaged over the entire body)	Partial-Body (averaged over any 1g of tissue)	Hands, Wrists, Feet and Ankles (averaged over any 10g of tissue)
(A) Limits for Occupational /Controlled Exposure (W/kg)	0.4	8.0	20.0
(B) Limits for General population /Uncontrolled Exposure (W/kg)	0.08	1.6	4.0

*. Occupational/Controlled Environments: are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure, (i.e. as a result of employment or occupation).

*. General Population/Uncontrolled Environments: are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.

The limit applied in this test report is;

General population / uncontrolled exposure, Extremity (averaged over any 10g of tissue) limit: 4 W/kg (Wrist)
General population / uncontrolled exposure, Partial-Body (averaged over any 1g of tissue) limit: 1.6 W/kg (Next-to-Mouth)

*. Tested platform is a wristwatch which support the voice command.

Test outline: Where the EUT is built into a platform, it was verified whether multi-platform conditions can be suited in according with section 2) of 5.2.2 in KDB447498 D01 (v06).

Consideration of the test results:	The highest reported SAR (1g) and SAR (10g) of this platform was kept; ≤ 0.4 W/kg. Since highest reported SAR (1g) on this EUT's platform obtained in accordance with KDB447498 D01 (v06) was kept under 0.4 W/kg, this EUT was approved to operate multi-platform (limited to the wristwatch type).

3.6 Confirmation before SAR testing

Before SAR test, the RF wiring for the sample had been switched to the antenna conducted power measurement line from the antenna line and the average power was measured. The result is shown in Section 6.

*. The platform transmission power was verified that it was within 2dB lower than the maximum tune-up tolerance limit when it was set the rated power. (Clause 4.1, KDB447498 D01 (v06))

Step.1 Data rate check (*. The power measurement was applied to the following data rate in each operation mode.)

b		g				n20 (SS×1)						Bluetooth

*. Data rate: [Mbps]; SS: Spatial Stream; b: IEEE 802.11b, g: IEEE 802.11g, n20: IEEE 802.11n(20HT); BLE: Bluetooth Low Energy; BDR: Basic Data Rate; EDR: Enhanced Data Rate.

Step.2 Consideration of SAR test channel

For the SAR test reference, on each operation band, the average output power was measured on the low/middle/upper and specified channels with the worst data rate condition in step 1 in the above.

3.7 Confirmation after SAR testing

It was checked that the power drift [W] is within $\pm 5\%$ in the evaluation procedure of SAR testing. The verification of power drift during the SAR test is that DASY5 system calculates the power drift by measuring the e-filed at the same location at beginning and the end of the scan measurement for each test position.

The result is shown in APPENDIX 2.

*. DASY5 system calculation Power drift value[dB] = $20\log(E_a)/(E_b)$ (where, Before SAR testing: E_b [V/m] / After SAR testing: E_a [V/m])

Limit of power drift[W] = $\pm 5\%$

Power drift limit (X) [dB] = $10\log(P_drift) = 10\log(1.05/1) = 10\log(1.05) - 10\log(1) = 0.21$ dB

from E-filed relations with power.

$S = E \times H = E^2 / \eta = P / (4 \times \pi \times r^2)$ (η : Space impedance) $\rightarrow P = (E^2 \times 4 \times \pi \times r^2) / \eta$

Therefore, The correlation of power and the E-filed

Power drift limit (X) dB = $10\log(P_drift) = 10\log(E_drift)^2 = 20\log(E_drift)$

From the above mentioned, **the calculated power drift of DASY5 system must be the less than ± 0.21 dB.**

SECTION 4: Operation of EUT during testing

4.1 Operating modes for SAR testing

This EUT has IEEE 802.11b, 11g and 11n(20HT) and Bluetooth (BDR/EDR/BLE) continuous transmitting modes. The frequency and the modulation used in the SAR testing are shown as a following.

Operation mode		BDR	EDR		BLE	b	g	n20

*. Any output power reducing for channel 1 and 11 to meet restricted band requirements was not observed.

*. (KDB248227 D01 (v02r02)) Since the reported SAR of the highest measured maximum output power channel is ≤ 0.8 W/kg, the SAR testing for other channels were omitted. However, the SAR testing was applied to lower, middle and upper channels for the worst SAR condition.

4.2 Test setup and SAR measurement procedure

Antenna separation distances in each test setup plan are shown as follows.

*. D: Antenna separation distance. It is the distance from the EUT antenna inside a platform to the outer surface of platform which an operator may touch.

. Size of platform: round shape, 60 mm (length) $\times$ 60 mm (width) $\times$ 20 mm (thickness) (: excluding wrist band.)

*. Consideration for SAR evaluation exemption

*1. It was applied the SAR test procedure "KDB447498 D01 (v06), Clause 6.2. Wrist watch and wrist-worn transmitters", because this platform which has EUT built-in is a wristwatch and the voice command is supported.

According to KDB447498 D01 (v06), Clause 6.2. Wrist watch and wrist-worn transmitters:

Transmitters that are built-in within a wrist watch or similar wrist-worn devices typically operate in speaker mode for voice communication, with the device worn on the wrist and positioned next to the mouth. Next to the mouth exposure requires 1-g SAR and the wrist-worn condition requires 10-g extremity SAR. The 10-g extremity and 1-g SAR test exclusions may be applied to the wrist and face exposure conditions. When SAR evaluation is required, next to the mouth use is evaluated with the front of the device positioned at 10 mm from a flat phantom filled with head tissue-equivalent medium. The wrist bands should be strapped together to represent normal use conditions. SAR for wrist exposure is evaluated with the back of the device positioned in direct contact against a flat phantom filled with body tissue-equivalent medium. The wrist bands should be unstrapped and touching the phantom. The space introduced by the watch or wrist bands and the phantom must be representative of actual use conditions; otherwise, if applicable, the neck or a curved head region of the SAM phantom may be used, provided the device positioning and SAR probe access issues have been addressed through a KDB inquiry. When other device positioning and SAR measurement considerations are necessary, a KDB inquiry is also required for the test results to be acceptable; for example, devices with rigid wrist bands or electronic circuitry and/or antenna(s) incorporated in the wrist bands. These test configurations are applicable only to devices that are worn on the wrist and cannot support other use conditions; therefore, the operating restrictions must be fully demonstrated in both the test reports and user manuals.

*2. SAR test exclusion considerations according to KDB447498 D01

Step 1) The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50 mm are determined by:

$$[(\text{max.power of channel, including tune-up tolerance, mW}) / (\text{min.test separation distance, mm})] \times [\sqrt{f}(\text{GHz})] \leq 3.0 \text{ (for SAR(1g)), } 7.5 \text{ (for SAR(10g))} \quad \dots \text{ formula (1)}$$

If power is calculated from the upper formula (1);

$$[\text{SAR(1g) test exclusion thresholds, mW}] = 3 \times [\text{test separation distance, mm}] / [\sqrt{f}(\text{GHz})] \quad \dots \text{ formula (2)}$$

1. The upper frequency of the frequency band was used in order to calculate standalone SAR test exclusion considerations.

2. Power and distance are rounded to the nearest mW and mm before calculation

3. The result is rounded to one decimal place for comparison

4. The test exclusions are applicable only when the minimum test separation distance is ≤ 50 mm and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion.

When the calculated threshold value by a numerical formula above-mentioned in the following table is 3.0 (or less) for SAR 1g (next-to-mouth), nor 7.5 (or less) for SAR 10g (wrist-touch), SAR test can be excluded.

[SAR exclusion calculations for step 1) antenna ≤50mm from the user]

Step 1) SAR exclusion calculations for antenna ≤50mm from the user.

<Conclusion for consideration for SAR test reduction>

- 1) Tested platform is a wristwatch with the watch-wristband which can't be removed easily. This platform is usually worn on the wrist. Since the platform has sound responsive function, the platform is used in front of the mouth when a voice input is operated.
- 2) So, the "Back" setup is considered extremity (wrist) SAR (touch) and is applied the SAR test in body-liquid.
- 3) So, the "Front" setup is considered partial body SAR (next-to-mouth, 10 mm separation gap) and is applied the SAR test in head-liquid.

By the determined test setup shown above, the SAR test was applied in the following procedures.

Step 1	Worst extremity SAR(10g) (wrist) search of DSSS mode; Determine the highest reported SAR(10g) of DSSS mode. (*. Change the channel and mode, if it is necessary.)
Step 2	Worst partial body SAR(1g) (next-to-mouth) search of DSSS mode; Determine the highest reported SAR(1g) of DSSS mode. (*. Change the channel and mode, if it is necessary.)

*. During SAR test, the radiated power is always monitored by Spectrum Analyzer.

SECTION 5: Uncertainty Assessment (SAR measurement)

Although this standard determines only the limit value of uncertainty, there is no applicable rule of uncertainty in this. Therefore, the following results are derived depending on whether or not laboratory uncertainty is applied.

Uncertainty of SAR measurement (2.4-6GHz) (*.ε&σ: ≤± 5%, DAK3.5, Tx: ≈100% duty cycle) (v08)							1g SAR	10g SAR

*. Table of uncertainties are listed for ISO/IEC 17025.

*. This measurement uncertainty budget is suggested by IEEE Std.1528(2013) and determined by Schmid & Partner Engineering AG (DASY5 Uncertainty Budget). Per KDB 865664 D01 (v01r04) SAR Measurement 100 MHz to 6 GHz, Section 2.8.1., when the highest measured SAR(1g) within a frequency band is < 1.5W/kg, the extensive SAR measurement uncertainty analysis described in IEEE Std.1528 (2013) is not required in SAR reports submitted for equipment approval.

*c. Since the calculated ΔASAR values of the tested liquid had shown positive correction, the measured SAR was not converted by ΔASAR correction.

Calculating formula: $\Delta\text{ASAR corrected SAR (W/kg)} = (\text{Meas. SAR (W/kg)}) \times (100 - (\Delta\text{ASAR}(\%))) / 100$

*d. Calculating formula: $\text{Reported SAR (W/kg)} = (\text{Measured SAR (W/kg)}) \times (\text{Duty scaled}) \times (\text{Tune-up factor})$

Duty scaled = Duty scaled factor: Duty cycle correction factor for obtained SAR value, Duty scaled factor [-] = $100(\%) / (\text{duty cycle, } \%)$

Tune-up factor: Power tune-up factor for obtained SAR value, Tune-up factor [-] = $1 / (10^{(\text{"Deviation from max., dB"} / 10)})$

(Clause 5.2, 2.4GHz SAR Procedures, in KDB248227 D01 (v02r02))**5.2.1 802.11b DSSS SAR Test Requirements**

SAR is measured for 2.4 GHz 802.11b DSSS using either a fixed test position or, when applicable, the initial test position procedure. SAR test reduction is determined according to the following:

- 1) When the reported SAR of the highest measured maximum output power channel for the exposure configuration is ≤ 0.8 W/kg, no further SAR testing is required for 802.11b DSSS in that exposure configuration.

5.2.2 2.4 GHz 802.11g/n OFDM SAR Test Exclusion Requirements

When SAR measurement is required for 2.4 GHz 802.11g/n OFDM configurations, the measurement and test reduction procedures for OFDM are applied (section 5.3, including sub-sections). SAR is not required for the following 2.4 GHz OFDM conditions.

- 1) When KDB Publication 447498 SAR test exclusion applies to the OFDM configuration.
- 2) When the highest reported SAR for DSSS is adjusted by the ratio of OFDM to DSSS specified maximum output power and the adjusted SAR is ≤ 1.2 W/kg.

* SAR test of OFDM mode was reduced, because the estimate reported SAR of OFDM mode was ≤ 1.2 W/kg by using the highest reported SAR of DSSS mode.
