## **1 GENERAL INFORMATION**

### **1.1 SCOPE**

FCC Rules Part 15.247: Frequency Hopping, Direct Spread Spectrum and Hybrid Systems that are in operation within the bands of 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz.

IC RSS-210 Section 6.2.2(o): Frequency Hopping, Direct Spread Spectrum, and Hybrid Systems that are in operation within the bands of 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz.

### **1.2 TEST FACILITY**

The open area test site and conducted measurement facility used to collect the radiated data is located at 360 Herndon Parkway, Suite 1400, Herndon, Virginia 20170. This site has been fully described in a report and approved by the Federal Communications Commission to perform AC line conducted and radiated emissions testing (ANSI C63.4 2003).

### **1.3 RELATED SUBMITTAL(S)/GRANT(S)**

This is an original FCC certification application for Limited Modular transmitter approval per DA 00-1407 for Zebra Technologies Corp., Model Name: ZLAN11B, Model Number: AT17192-1, FCC ID: I28MD-ZLAN11B.

The applicant requests LIMITED MODULAR APPROVAL to allow the use of this radio in Zebra printers and other Zebra products similar in style to those presented in this report, including housing type and materials, and not limited to the printers in this report. Appendix E of this report includes a letter from the applicant justifying the LIMITED MODULAR APPROVAL request. The IF, LO and up to the 2<sup>nd</sup> LO were also investigated and tested.

With respect to Industry Canada, IC: 3798A-ZLAN11B the applicant requests MODULAR APPROVAL, based on RSS-210, Section 5.18. The application includes a letter from the applicant justifying Modular Approval under the conditions set forth in the RSS-210 standard.

### **1.4 MODIFICATIONS**

No modifications were implemented to meet testing criteria.

## 2 TEST INFORMATION

### 2.1 TEST JUSTIFICATION

The EUT was tested in all three orthogonal planes in order to determine worst-case emissions. Channel 1 at 2412 MHz, Channel 6 at 2437 MHz, and Channel 11 at 2462 MHz were tested and investigated from 9 kHz to 24 GHz. Data for all three channels are presented in this report.

The EUT is connected to an external dipole antenna mounted in representative printers in which it will be used. This antenna transmits, receives, and is connected to the antenna port.

The worst case data taken in this report represents the highest data rate at 11 MBPS. Data rates of 5.5 MBPS, 2 MBPS and 1 MBPS were investigated and found to be in compliance. The change in envelope did not cause the EUT to be non-compliant in any of the aforementioned modes.

### 2.2 EXERCISING THE EUT

The EUT was provided with the software to continuously transmit during testing. The carrier was also checked to verify that the information was being transmitted. There were no deviations from the test standard(s) and/or methods.

#### **4 COMPLIANCE WITH THE RESTRICTED BAND EDGE - FCC §15.247(C), §15.205; IC RSS-210 §6.3**

##### **4.1 BAND EDGE TEST PROCEDURE**

Compliance with the band edges was performed using the FCC's "Radiated Measurement at a Band Edge" guidance document. The final data derived below were from radiated measurements only. The data shown in this report represents the worst case at 11 MBPS. Data rates of 5.5 MBPS, 2 MBPS, and 1 MBPS were investigated and found to be in compliance.

##### **4.2 RESTRICTED BAND EDGE PLOTS**

###### **Calculation of Lower Band Edge**

The level 106.5 dBuV/m is the worst case average field strength measurement, from which the delta measurement of 52.8 dB is subtracted (reference plots), which is equivalent to a level of 53.7 dB. This level has a margin of 0.3 dB under the limit of 54 dBuV/m.

Calculation:  $106.5 \text{ dBuV/m} - 52.8 \text{ dB} - 54 \text{ dBuV/m} = -0.3 \text{ dB}$

## **5 CONDUCTED EMISSIONS – FCC §15.207; IC RSS-210 §6.6 AND 7.4**

### **5.1 TEST METHODOLOGY FOR CONDUCTED EMISSIONS MEASUREMENTS**

The power line conducted emission measurements were performed in a Series 81 type shielded enclosure manufactured by Rayproof. The EUT was assembled on a wooden table 80 centimeters high. Power was fed to the EUT through a 50 ohm / 50 microhenry Line Impedance Stabilization Network (EUT LISN). The EUT LISN was fed power through an A.C. filter box on the outside of the shielded enclosure. The filter box and EUT LISN housing are bonded to the ground plane of the shielded enclosure. A second LISN, the peripheral LISN, provides isolation for the EUT test peripherals. This peripheral LISN was also fed A.C. power. A metal power outlet box, which is bonded to the ground plane and electrically connected to the peripheral LISN, powers the EUT host peripherals.

The spectrum analyzer was connected to the A.C. line through an isolation transformer. The 50 ohm output of the EUT LISN was connected to the spectrum analyzer input through a Solar high-pass filter. The filter is used to prevent overload of the spectrum analyzer from noise below 150 kHz. Conducted emission levels were measured on each current-carrying line with the spectrum analyzer operating in the CISPR quasi-peak mode (or peak mode if applicable). The analyzer's 6 dB bandwidth was set to 9 kHz. No video filter less than 10 times the resolution bandwidth was used. Average measurements are performed in linear mode using a 10 kHz resolution bandwidth, a 1 Hz video bandwidth, and by increasing the sweep time in order to obtain a calibrated measurement. The emission spectrum was scanned from 150 kHz to 30 MHz. The highest emission amplitudes relative to the appropriate limit were measured and have been recorded in this report.

*Note: Rhein Tech Laboratories, Inc. has implemented procedures to minimize errors that occur from test instruments, calibration, procedures, and test setups. Test instrument and calibration errors are documented from the manufacturer or calibration lab. Other errors have been defined and calculated within the Rhein Tech Quality Manual, Section 6.1. Rhein Tech implements the following procedures to minimize errors that may occur: yearly as well as daily calibration methods, technician training, and emphasis to employees on avoiding error.*

### **5.2 CONDUCTED EMISSIONS TEST**

The initial step in collecting conducted data is a spectrum analyzer peak scan of the measurement range. If the conducted emissions exceed the limit, then the instrument is set to the quasi-peak mode and compared to the quasi-peak limit, then measurements are made in the average mode and compared to the average limit. The conducted test was performed with the EUT exercise program loaded, and the emissions were scanned between 150 kHz to 30 MHz on the NEUTRAL SIDE and PHASE SIDE.

**6 RADIATED EMISSIONS FOR RECEIVER/DIGITAL INTERFACE – FCC §15.209; IC RSS-210 §7.3**

**6.1 RADIATED EMISSIONS TEST PROCEDURE FOR RECEIVER/DIGITAL INTERFACE**

Radiated spurious emissions for receiver/digital interface fall in the restricted and non-restricted bands between 30 MHz and up to the 2<sup>nd</sup> LO when the EUT is in the receiver/digital interface mode. The IF, LO and up to the 2<sup>nd</sup> LO of the receiver were investigated and tested. Channels 1, 6, and 11 were tested and investigated and the highest levels measured are presented. The restricted bands are listed in FCC Part 15.205 and the maximum permitted average field strength for the restricted band is listed in Part 15.209. The data in this report represents the worst case modes.

**7 RADIATED EMISSION RADIATED HARMONICS/SPURIOUS NOISE – FCC §15.247; IC RSS-210 §6.2.2(O)(E1); §6.3**

**7.1 RADIATED EMISSION TEST PROCEDURE FOR HARMONICS/SPURIOUS NOISE**

Radiated Spurious Emissions applies to harmonics and spurious emissions that fall in the restricted bands when the EUT is configured in the transmit mode. The restricted bands are listed in Part 15.205. The maximum permitted average field strength for the restricted band is listed in Part 15.209. The EUT was tested in three orthogonal planes from 10 kHz to the 10<sup>th</sup> harmonic of the fundamental. The data in this report represents the worst case modes.

## 8 MODULATED BANDWIDTH – FCC §15.247(A)(2)

### 8.1 MODULATED BANDWIDTH TEST PROCEDURE

The minimum 6 dB bandwidth per FCC 15.247 (a)(2) was measured using a 50 ohm spectrum analyzer with the resolution bandwidth set at 100 kHz, and the video bandwidth set at 1 MHz. The minimum 6 dB modulated bandwidths are the following:

## 9 ANTENNA CONDUCTED SPURIOUS EMISSIONS – FCC §15.247(C); IC RSS-210 §6.2.2(O)(E1)

### 9.1 ANTENNA CONDUCTED SPURIOUS EMISSIONS TEST PROCEDURES

Antenna spurious emission per FCC 15.247(c) was measured from the EUT antenna port using a 50 ohm spectrum analyzer with the resolution bandwidth set at 100 kHz, and the video bandwidth set at 300 kHz. The modulated carrier was identified at 2.412 GHz for Channel 1, 2.437 GHz for Channel 6, and 2.462 GHz for Channel 11. No other harmonics or spurs were found within 20 dB of the carrier level, and from 9 kHz to the carriers 10<sup>th</sup> harmonic. A notch filter was not used; it was found to have no effect in the levels.

Channels 1, 6, and 11 were investigated and tested.

## 10 POWER SPECTRAL DENSITY – FCC §15.247(D); IC RSS-210 §6.2.2(O)(B)

### 10.1 POWER SPECTRAL DENSITY TEST PROCEDURE

The power spectral density per FCC 15.247(d) was measured using a 50 ohm spectrum analyzer with the resolution bandwidth set at 3 kHz, the video bandwidth set at 30 kHz, and the sweep time set at 500 seconds. The test was performed as a conducted test. The spectral lines were resolved for the modulated carriers at 2.412 GHz, 2.437 GHz, and 2.462 GHz respectively. These levels are well below the +8 dBm limit. See the power spectral density table and plots that follow.
