Hearing Aid Compatibility (HAC)
RF Emission Test Report

APPLICANT	:	BLU Products, Inc.
PRODUCT NAME	:	Smart Phone
MODEL NAME	:	G65L
BRAND NAME	:	BLU
FCC ID	:	YHLBLU65LW
STANDARD(S)	:	FCC 47 CFR Part 20 (20.19)
		ANSI C63.19-2019
RECEIPT DATE	:	2024-12-10
TEST DATE	:	2024-12-12 to 2024-12-21
ISSUE DATE	:	2025-01-15

Edited by: _Pang Siyu_

Pang Siyu (Rapporteur)

Approved by: _Gan Yueming_

Gan Yueming (Supervisor)

NOTE: This document is issued by Shenzhen Morlab Communications Technology Co., the test report shall not be reproduced except in full without prior written permission of the company. The test results apply only to the particular sample(s) tested and to the specific tests carried out which is available on request for validation and information confirmed at our website.

Change History		
Version	**Date**	**Reason for change**
1.0	2025-01-15	First edition

1. Statement of RF Emission

The worst RF audio interference level found during test as bellows:

Air Interface	Frequency Band	RF$_{AIL}$ **[dB(V/m)]**
GSM CMRS Voice	GSM850	36.73
	GSM1900	32.35

Note:

1. This device is in compliance with compliance with RF$_{AIL}$ requirements specified in FCC 47 CFR Part 20.19 and tested in accordance with the measurement methods and procedures specified in ANSI C63.19-2019 and FCC KDB publications.
2. The test used the max power of the device when held to the head for all users.
3. When the test result is a critical value, we will use the measurement uncertainty give the judgment result based on the 95% confidence intervals.

2.3. Photographs of the EUT

Note: Please refer to the External Photos for the Photos of the EUT

2.4. Applied Reference Documents

Leading reference documents for testing:

Identity	Document Title	Method determination /Remark
FCC 47 CFR Part 20 (20.19)	Hearing aid-compatible mobile handsets	No deviation
ANSI C63.19-2019	American National Standard Methods of Measurement of Compatibility between Wireless Communications Devices and Hearing Aids	No deviation
KDB 285076 D01v06r04	HAC Guidance	No deviation
KDB 285076 D03v01r06	HAC FAQ	No deviation

3. Air Interface and Operating Mode

Air Interface	Band	Transport Type	ANSI C63.19 Tested	Simultaneous Transmitter	Name of Voice Service	Power Reduction
GSM	GSM850	VO	Yes	WLAN, BT	CMRS Voice	No
	GSM1900					No
	EDGE 850	DT	No (note 6)	WLAN, BT	N/A	No
	EDGE 1900					No
WCDMA (UMTS)	Band II	VO	No (note 6)	WLAN, BT	CMRS Voice	No
	Band IV					No
	Band V					No
	HSPA	DT	No	WLAN, BT	N/A	No
FDD-LTE	Band 2	VD	No (note 6)	WLAN, BT	VoLTE	No
	Band 4					No
	Band 5					No
	Band 7					No
	Band 12					No
	Band 17					No
	Band 66					No
	Band 71					No
WiFi	2450	VD	No (note 6)	GSM, UMTS, LTE	VoWiFi	No
	5200 (U-NII-1)					No
	5300 (U-NII-2A)					No
	5800 (U-NII-3)					No
BT	2450	DT	No (note 6)	GSM, UMTS, LTE	N/A	No

Note:

1) Air Interface/Band MHz: List of all air interfaces and bands supported by the handset.

2) Type: For each air interface, indicate the type of voice transport mode:
   i. VO = legacy Cellular Voice Service, from ANSI C63.19-2019;
   ii. DT = Digital Transport only (no voice); and
   iii. VD = IP Voice Service over Digital Transport.

3) Simultaneous Transmitter: Indicate any air interface/bands that operate in simultaneous or concurrent service transmission mode.

4) Name of Voice Service: See Q4 in 285076 D03 HAC FAQ for further clarification.

5) Set device to highest device transmit power in a held to the ear mode.

6) The RF Emission for UMTS, FDD-LTE and WLAN measurement is not required and the exemption was evaluated in section 10.

4. WD Emission Requirements

According to ANSI C63.19-2019, the WD's conducted power must be at or below either the stated RF_{AIPL} (Table 4.1) or the stated peak power level (Table 4.2), or the average near-field emissions over the measurement area must be at or below the stated RF_{AIL} (Table 4.3), or the stated peak field strength (Table 4.4). The WD may demonstrate compliance by meeting any of these four requirements, but it must do so in each of its operating bands at its established worst-case normal speech-mode operating condition.

Table 4.1—Wireless device RF audio interference power level	
Frequency Range (MHz)	RF_{AIPL} (dBm)
<960	29
960–2000	26
>2000	25

Table 4.2—Wireless device RF peak power level	
Frequency Range (MHz)	$RF_{Peak\ Power}$ (dBm)
<960	35

5. HAC (RF) Measurement System
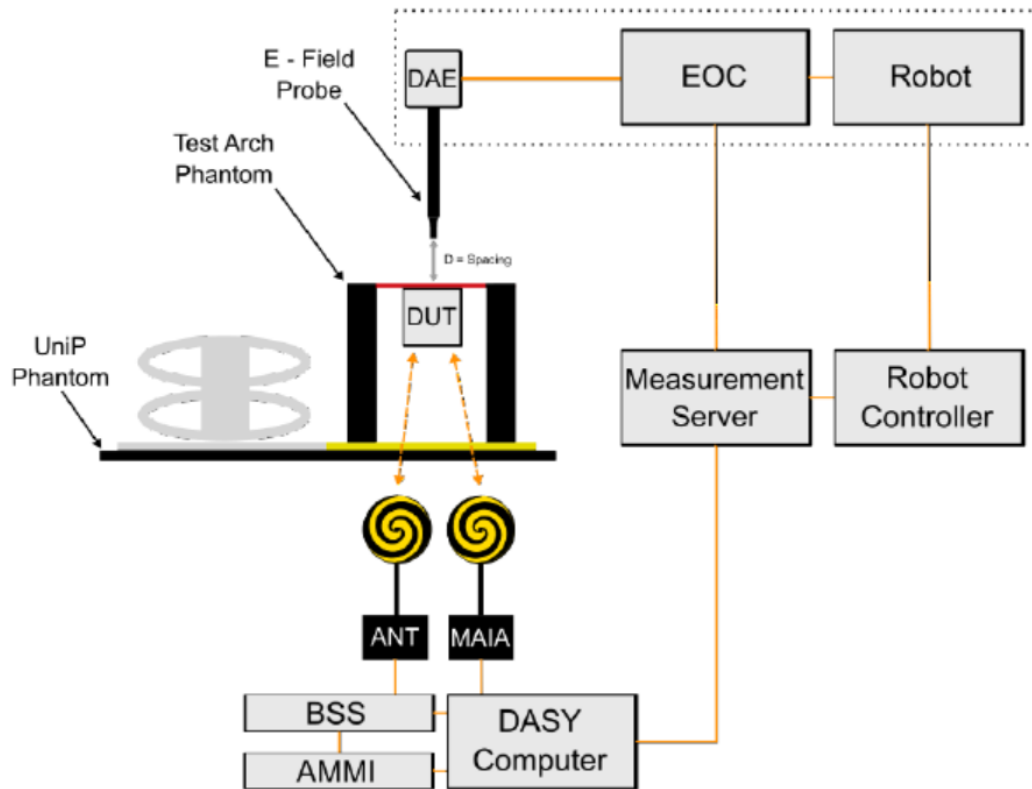

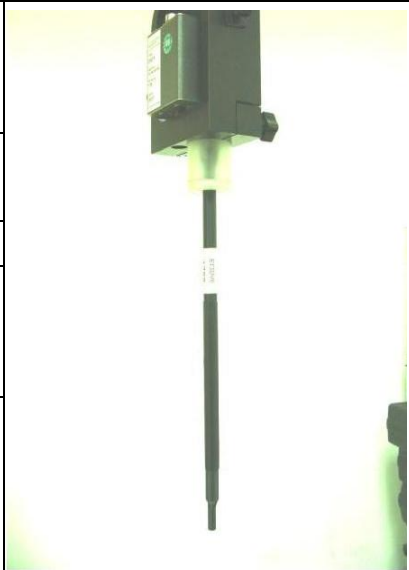

5.1. RF Measurement Setup

Fig 5.1 Typical DASY6/8 setup for HAC RF signal test

5.2. E-Field Probe

The RF measurement is conducted with the dosimetric probe (manufactured by SPEAG). The probe is specially designed and calibrated for use with high permittivity. The dosimetric probe has special calibration at different frequency. This probe has a built in optical surface detection system to prevent from collision with phantom.

E-Field Probe Specification
<ER3DV6>

Construction	One dipole parallel, two dipoles normal to probe axis Built-in shielding against static charges	
Calibration	In air from 100 MHz to 3.0 GHz (Absolute accuracy ±6.0%, k=2)	
Frequency	10 MHz to 6 GHz; Linearity: ± 0.2 dB	
Directivity	± 0.2 dB in HSL (rotation around probe axis) ± 0.4 dB in HSL (rotation normal to probe axis)	
Dynamic Range	2 V/m to 1000 V/m (M3 or better device readings fall well below diode compression point)	
Linearity	± 0.2 dB	
Dimensions	Overall length: 330 mm (Tip: 16 mm) Tip diameter: 8 mm (Body: 12 mm) Distance from probe tip to dipole centers: 2.5 mm	**Fig 5.2 Photo of ER3DV6**
Probe Tip Description: HAC field measurements take place in the close near field with high gradients. Increasing the measuring distance from the source will generally decrease the measured field values (in case of the validation dipole approx. 10%per mm).		

<Voltage to E-field Conversion>

The measured voltage is first linearized to a quantity proportional to the square of the E-field using the (a, b, c, d) set of parameters specific to the communication system and sensor:

$$V_{\text{compi}} = U_i + U_i^2 \cdot \frac{10^{\frac{d}{10}}}{dcp_i}$$

where V_{compi} = compensated voltage of channel i (µV) (i = x,y,z)

U_i = input voltage of channel i (µV) (i = x,y,z)

d = PMR factor d (dB) (Probe parameter)

d_{cpi} = diode compression point of channel i (µV) (Probe parameter, i = x,y,z)

$$V_{compi_{dB\sqrt{\mu V}}} = 10 \cdot \log_{10}(V_{compi})$$

$$corr_i = a_i \cdot e^{-\left(\frac{V_{compi_{dB\sqrt{\mu V}}} - b_i}{c_i}\right)^2}$$

where $corr_i$ = correction factor of channel i (dB) (i = x,y,z)

$V_{compi_{dB\sqrt{\mu V}}}$ = compensated voltage of channel i (dB$\sqrt{\mu V}$) (i = x,y,z)

a_i = PMR factor a of channel i (dB) (Probe parameter, i = x,y,z)

b_i = PMR factor b of channel i (dB$\sqrt{\mu V}$) (Probe parameter, i = x,y,z)

c_i = PMR factor c of channel i (Probe parameter, i = x,y,z).

The voltage $V_{idB\sqrt{\mu V}}$ is the linearized voltage in dB$\sqrt{\mu V}$

$$V_{idB\sqrt{\mu V}} = V_{compi_{dB\sqrt{\mu V}}} - corr_i$$

Where $V_{idB\sqrt{\mu V}}$ = linearized voltage of channel i (dB$\sqrt{\mu V}$) (i = x,y,z)

$V_{compi_{dB\sqrt{\mu V}}}$ = compensated voltage of channel I (dB$\sqrt{\mu V}$) (i = x,y,z)

$corr_i$ = correction factor of channel i (dB) (i = x,y,z)

Finally, the linearized voltage is converted in µV:

$$V_i = 10^{\frac{V_{i_{dB\sqrt{\mu V}}}}{10}}$$

The E-field data for each channel are calculated using the linearized voltage:

$$E\text{-field probes:} \quad E_i = \sqrt{\frac{V_i}{Norm_i \cdot ConvF}}$$

Where V_i = linearized voltage of channel i (i = x,y,z)

$Norm_i$ = sensor sensitivity (µV/(V/m)2) of channel i (i = x,y,z)

ConvF = sensitivity enhancement in solution

E_i = electric field strength of channel i in V/m.

The RMS value of the field components gives the total field strength (Hermitian magnitude):

$$E_{tot} = \sqrt{E_x^2 + E_y^2 + E_z^2}.$$

Page 12 of 28

<Averaged E-field Calculation>

The averaged E-field is defined by

$$E_{avg} = \frac{1}{n} \cdot \sum_{i=1}^{n} E_i$$

where   n = the number of measurement grid point

Ei = the E-field measured at point i.

<RFail Calculation>

The RFail is finally computed with

RFail [dB(V=m)] = 20 · log$_{10}$(E$_{avg}$) + MIF

Where   RFail = the Radio Frequency Audio Interference Level in dB(V/m)

E$_{avg}$ = the averaged E-field in (V/m) calculated

MIF   = the Modulation Interference Factor in dB.

5.3. Data Acquisition Electronics (DAE)

The data acquisition electronics (DAE) consists of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16 bits AD-converter and a command decoder and control logic unit. AD-converter and a command decoder and control logic unit. Transmission to the measurement server is accomplished through an optical downlink for data and status information as well as an optical uplink for commands and the clock.

The input impedance of the DAE is 200 MOhm; the inputs are symmetrical and floating. Common mode rejection is above 80 dB.

Fig 5.3 Photo of DAE

6. RF Emission Measurement Procedure

6.1. Test Procedure: Direct Measurement—Alternative

The following methods are example step-by-step test procedures. Other comparable procedures may be used. Either manual or automatic test procedures may be used. The automated test procedure is preferred.

Test Instructions

> Confirm proper operation of probes and instrumentation
> Position WD
> Configure WD TX operation

Per 5.4.1.2 (1-3)

> Initialize field probe
> Scan Area

Per 5.4.1.2 (4-6)

> Identify exclusion area.
> Rescan or reanalyze open area to determine maximum
> **Direct method:** Record RF Audio Interference Level, in dB(V/m)
> **Indirect method:** Add the MIF to the maximum steady state rms field strength and record RF Audio Interference Level, in dB(V/m)

Per 5.4.1.2 (7-9) & 5.4.1.3

> Identify and record the category

Per 5.4.1.2 (9-10)

Fig 6.1 WD near-field emission scan flowchart

Page 14 of 28
Fig 6.2 WD measurement and reference planes for RF emission measurements
Fig 6.3 Device Under Test Positioning under the Test Arch

6.2. Test Procedure: Indirect Measurement—Preferred

1. Confirm the proper operation of the field probe, probe measurement system, and other instrumentation and the positioning system.

2. Position the WD in its intended test position. A gauge block, depicted in A.1.2, can simplify this positioning.

3. Set the WD to transmit a fixed and repeatable combination of signal power and modulation characteristic that is representative of the worst case (highest interference potential) encountered in normal use. Transiently occurring start-up, changeover, or termination conditions, or other operations likely to occur less than 1% of the time during normal operation, may be excluded from consideration. Transiently occurring start-up, changeover, or termination conditions, or other operations likely to occur less than 1% of the time during normal operation, may be excluded from consideration.

4. The measurement area shall be centered on the acoustic output or the T-Coil mode measurement reference point, as appropriate. Locate the field probe at the initial test position in the 50 mm by 50 mm measurement area, which is contained in the measurement plane, described in 4.5.2 and illustrated in Figure A.1. If the field alignment method is used, align the probe for maximum field reception.

5. Record the reading at the output of the measurement system.

6. Scan the entire 50 mm by 50 mm measurement area in equally spaced step sizes and record the reading at each measurement point. The step size shall meet the specification for step size in 4.5.3.

7. Calculate the average of the measurements taken in Step 6.

8. Convert the average value found in Step g) to RF audio interference level, in volts per meter, by taking the square root of the reading and then dividing it by the measurement system transfer function, as established in 4.5.3.2.1 pre-test procedure. Convert the result to dB(V/m) by taking the base-10 logarithm and multiplying it by 20. Expressed as a formula:

$$\text{RF audio interference level in db (V/m)} = 20 \cdot \log (R_{ave}^{1/2} / TF)$$

Where R_{ave} is the average reading

9. Comparing this RF audio interference level to the limits in 4.7 of ANSI C63.19-2019 and record the result.

7. Test Equipment List

Manufacturer	Name of Equipment	Type/Model	Serial No./ SW Version	Last Cal.	Due Date
SPEAG	DOSIMETRIC ASSESSMENT SYSTEM Software	cDASY6 HAC	V1.2	None	None
SPEAG	Dipole	CD835V3	1113	2021-10-23	2025-04-22
SPEAG	Dipole	CD1880V3	1111	2021-10-23	2025-04-22
SPEAG	E-Field Probe	ER3DV6	2434	2024-10-24	2025-10-23
SPEAG	Data Acquisition Electronics	DAE4	480	2024-11-11	2025-11-10
Agilent	Signal Generator	SMR20/20G	1104.0002.20	2023-12-03	2024-12-02
Agilent	Power Senor	NRP8S	103240	2024-01-25	2025-01-24
Agilent	Power Meter	NRP8S	103215	2024-01-25	2025-01-24
R&S	Base Station	CMW500	165755	2024-01-25	2025-01-24
Woken	Attenuation	None	351-218-010	None	None
Mini-Circuits	Amplifier	ZHL-42W+	608501717	None	None

Note:

1. The Insertion Loss calibration of Dual Directional Coupler and Attenuator were characterized via the network analyzer and compensated during system check.

2. The dielectric probe kit was calibrated via the network analyzer, with the specified procedure (calibrated in pure water) and calibration kit (standard) short circuit, before the dielectric measurement. The specific procedure and calibration kit are provided by Speag.

3. In system check we need to monitor the level on the power meter, and adjust the power amplifier level to have precise power level to the dipole; the measured SAR will be normalized to 1W input power according to the ratio of 1W to the input power to the dipole. For system check, the calibration of the power amplifier is deemed not critically required for correct measurement; the power meter is critical and we do have calibration for it.

4. Attenuator insertion loss is calibrated by the network Analyzer, which the calibration is valid, before system check.

5. N.C.R means No Calibration Requirement.

8. System Validation

According to ANSI C63.19, before hearing aid testing commences, the experimental setup shall be validated. Sub clauses 6.3.1through 6.3.5 include a set of pretest procedures designed to validate the experimental setup to ensure the accuracy of the results. To verify that the hearing aid performs per the manufacturer's specifications, 6.3.5 advises that the hearing aid be pretested per ANSI S3.22.

8.1. Test setup

1. In the simplified setup for system evaluation, the EUT is replaced by a calibrated dipole and the power source is replaced by a continuous wave which comes from a signal generator.
2. Position the E-field probe at a 15 mm distance from the top surface of the dipole, which is also fixed in an appropriate fixture.
3. Make sure that the desired measuring channel of the probe is aligned for maximum reception of the E-field generated by the dipole. This may be accomplished by rotating the probe until the maximum value is located. The E-field probe shall have been calibrated over the frequency range to be measured using standard calibration techniques.
4. Adjust the power level (20dBm→100mW) of the signal generator at the initial starting frequency such that the desired E-field strength at the 15 mm distance from the tip of the dipole is achieved. Setting the field strength to be in the range of category M2 is advised.
5. Step the frequency in increments of ≤1%, adjusting the power fed into the dipole such that the desired E-field strength is maintained.
Fig 8.1 WD dipole calibration procedure

8.2. Validation Result

After testing, record the frequency and signal generator setting at each frequency for use during the actual immunity test. Comparing to the original E-field value provided by SPEAG, the verification data should be within its specification of 25 %. Table 6.1 shows the target value and measured value. The table below indicates the system performance check can meet the variation criterion and the plots can be referred to appendix A of this report. Deviation = ((Maximum E-field Value) - (Target value)) / (Target value) * 100%

Frequency (MHz)	Input Power (mW)	Target Value (V/m)	Emax (V/m)	Deviation (%)	Date
835	100	107	96.6	-9.72	2024/12/11
1880	100	80.9	87.4	8.03	2024/12/11

Page 19 of 28

9. Modulation Interference Factor

For any specific fixed and repeatable modulated signal, a Modulation Interference Factor (MIF, expressed in decibels) may be developed that relates its interference potential to its steady state rms signal level or average power level. This factor is a function only of the audio frequency amplitude modulation characteristics of the signal and is the same for field strength or conducted power measurements. It is important to emphasize that the MIF is valid only for a specific repeatable audio frequency amplitude modulation characteristic. Any change in modulation characteristic requires determination and application of a new MIF.

MIF may be determined using a radiated RF field, a conducted RF signal, or, in a preliminary stage, a mathematical analysis of a modeled RF signal.

1. Verify the slope accuracy and dynamic range capability over the desired operating frequency band of a fast probe or sensor, square-law detector, as specified in D.3, and weighting system as specified in D.4 and D.5. For the probe and instrumentation included in the measurement of MIF, additional calibration and application of calibration factors are not required.
2. Using RF illumination, or conducted coupling, apply the specific modulated signal in question to the measurement system at a level within its confirmed operating dynamic range.
3. Measure the steady-state rms level at the output of the fast probe or sensor.
4. Measure the steady-state average level at the weighting output.
5. Without changing the square-law detector or weighting system, and using RF illumination, or conducted coupling, substitute for the specific modulated signal a 1 kHz, 80% amplitude-modulated carrier at the same frequency and adjust its strength until the level at the weighting output equals the Step d) measurement.
6. Without changing the carrier level from Step e), remove the 1 kHz modulation and again measure the steady-state rms level indicated at the output of the fast probe or sensor.
7. The MIF for the specific modulation characteristic is given by the ratio of the Step 6 measurement to the Step 3 measurement, expressed in decibels (20*log(step 6/step 3).

In practice, Step 5 and Step 6 need not be repeated for each MIF determination if the relationship between the two measurements has been pre-established for the measurement system over the operating frequency and dynamic ranges. In such cases, only the modulation characteristic being tested needs to be available during WD testing.

MIF values applied in this test report were provided by the HAC equipment provider of SPEAG, and the worst values for all air interface are listed below to be determine the Low-power Exemption.

10616	IEEE 802.11ac WiFi (40MHz, MCS0, 99pc duty cycle)	-5.57
10626	IEEE 802.11ac WiFi (80MHz, MCS0, 99pc duty cycle)	-5.64
10636	IEEE 802.11ac WiFi (160MHz, MCS0, 99pc duty cycle)	-5.56
10671	IEEE 802.11ax WiFi (20MHz, MCS0, 99pc duty cycle)	-5.66
10707	IEEE 802.11ax WiFi (40MHz, MCS0, 99pc duty cycle)	-6.01
10731	IEEE 802.11ax WiFi (80MHz, MCS0, 99pc duty cycle)	-6.04
10743	IEEE 802.11ax WiFi (160MHz, MCS0, 99pc duty cycle)	-6.6
11026	IEEE 802.11be WiFi (20/40/80/160320MHz, MCS0, 99pc duty cycle)	-28.73

10. RF Audio Interference Power Level Evaluation

> **General Guidance**

1. The maximum conducted power including tune-up limit of each air interface will be used to plusing the MIF and evaluating whether it complies with the RF_{AIPL} requirements defined in ANSI C63.19-2019 section 4.7 Table 4.1, or the RF Emission should be measured and the test results complies with RF audio interference level requirements of Table 4.3.

2. The EDGE mode is not required since it is less than the GSM Voice mode for the conducted power including tune-up limit.

3. When the results that the maximum conducted power each air interface plus MIF complies with the RF_{AIPL} requirements, means it complies with the WD emission requirements per ANSI C63.19-2019.

4. The maximum power of higher frequency bands of FDD-LTE will be used to determining the RF_{AIPL}.

5. The maximum power including tune-up limit of each air interface was recorded in SAR report SZ24100313S01.

> **RF_{AIPL} Evaluation**

Air Interface	Max Average Antenna Input Power (dBm)	Worst Case MIF (dB)	Power + MIF(dB)	C63.19-2019 test required
GSM850	34.00	3.63	37.63	Yes
EDGE850	28.00	3.75	31.75	Yes
GSM1900	30.00	3.63	33.63	Yes
EDGE1900	28.00	3.75	31.75	Yes
WCDMA	24.00	-25.43	-1.43	No
LTE - FDD	25.00	-9.76	15.24	No
802.11b	19.50	-2.02	17.48	No
802.11g	18.00	0.12	18.12	No
802.11n-HT20	17.00	-13.44	3.56	No
802.11n-HT40	16.00	-13.44	2.56	No
802.11a	19.50	-3.15	16.35	No

11. Summary Test Results

> **General Guidance**

This device was tested under the maximum volume, backlight off and mute on.

> **RF$_{AIL}$ Test Results**

Plot No.	Air Interface	Modulation / Mode	Channel	MIF	RFAIPL (dBm)	Margin to FCC limit (dB)
	GSM 850	GSM Voice	128	3.63	35.44	-3.56
	GSM 850	GSM Voice	189	3.63	36.73	-2.27
	GSM 850	GSM Voice	251	3.63	35.19	-3.81
	GSM 1900	GSM Voice	512	3.63	32.35	-3.65
	GSM 1900	GSM Voice	661	3.63	32.2	-3.80
	GSM 1900	GSM Voice	810	3.63	31.95	-4.05

12. Uncertainty Assessment

The component of uncertainly may generally be categorized according to the methods used to evaluate them. The evaluation of uncertainly by the statistical analysis of a series of observations is termed a Type evaluation of uncertainty. The evaluation of uncertainty by means other than the statistical analysis of a series of observation is termed a Type B evaluation of uncertainty. Each component of uncertainty, however evaluated, is represented by an estimated standard deviation, termed standard uncertainty, which is determined by the positive square root of the estimated variance.

The combined standard uncertainty of the measurement result represents the estimated standard deviation of the result. It is obtained by combining the individual standard uncertainties of both Type A and Type B evaluation using the usual "root-sum-squares" (RSS) methods of combining standard deviations by taking the positive square root of the estimated variances. Expanded uncertainty is a measure of uncertainty that defines an interval about the measurement result within which the measured value is confidently believed tolie. It is obtained by multiplying the combined standard uncertainty by a coverage factor. For purpose of this document, a coverage factor two is used, which corresponds to confidence interval of about 95 %.

HAC Uncertainty Budget for ANSI C63.19-2019 600 - 6000 MHz, Scanning distance 15mm					
Error Description	**Uncertainty Value (±%)**	**Probe Distance**	**Div.**	**(Ci) Eav**	**Standard Uncertainty (Eav) (±%)**
Measurement System					
Probe Calibration	5.1	N	1	1	5.1
Axial Isotropy	4.7	R	1.732	1	2.7
Sensor Displacement	7.2	R	1.732	0.5	2.1
Boundary Effects	2.4	R	1.732	1	1.4
Phantom Boundary Effect	7.2	R	1.732	1	4.2
Probe Linearity	4.7	R	1.732	1	2.7
Scaling to Peak Power with MIF	10.0	R	1.732	1	5.8
System Detection Limit	1.0	R	1.732	1	0.6
Readout Electronics	0.3	N	1	1	0.3
Response Time	0.8	R	1.732	0	0
Integration Time	0.8	R	1.732	0	0
RF Ambient Conditions	2.6	R	1.732	1	1.7
RF Reflections	3.0	R	1.732	1	6.9
RF Reflections	12.2	R	1.732	1	6.9
Probe Positioner	1.2	R	1.732	1	0.7
Probe Positioning	3.0	R	1.732	1	1.7
Extrapolation and Interpolation	1.0	R	1.732	1	0.6
Test Sample Related					
Device Positioning Vertical	4.7	R	1.732	1	2.7
Device Positioning Lateral	1.0	R	1.732	1	0.6
Device Holder and Phantom	2.4	R	1.732	1	1.4
Power Drift	5.0	R	1.732	1	2.9
Phantom and Setup Related					
Phantom Thickness	2.4	R			
Combined Std. Uncertainty					13.2
Expanded Std. Uncertainty on Power					26.4
Expanded Std. Uncertainty on Field					13.2

Annex A General Information

1. Identification of the Responsible Testing Laboratory

Laboratory Name:	Shenzhen Morlab Communications Technology Co., Ltd.
Laboratory Address:	FL.1-3, Building A, FeiYang Science Park, No.8 LongChang Road, Block 67, BaoAn District, ShenZhen, GuangDong Province, P. R. China
Telephone:	+86 755 36698555
Facsimile:	+86 755 36698525

2. Identification of the Responsible Testing Location

Name:	Shenzhen Morlab Communications Technology Co., Ltd.
Address:	FL.1-3, Building A, FeiYang Science Park, No.8 LongChang Road, Block 67, BaoAn District, ShenZhen, GuangDong Province, P. R. China

3. Facilities and Accreditations

The FCC designation number is CN1192, the test firm registration number is 226174.
