1 GENERAL INFORMATION

1.1 GENERAL PRODUCT INFORMATION

| PRODUCT | viaim RecDot 2 | | | | | |
|----------------------------------|--|--|--|--|--|--|
| BRAND | viaim | | | | | |
| MODEL | XFVI-A96 | | | | | |
| | Earphone: | | | | | |
| | DC 3.85V from Li-ion Battery | | | | | |
| | Charging case: | | | | | |
| POWER SUPPLY | DC 3.85V from battery | | | | | |
| | DC 5V From WPT | | | | | |
| | DC 5V From USB host | | | | | |
| MODULATION MODE | Bluetooth® GFSK, π/4-DQPSK, 8-DPSK, LE(1M) | | | | | |
| OPERATING FREQUENCY ANTENNA TYPE | Bluetooth: 2402 MHz to 2480 MHz | | | | | |
| | Left: LDS Antenna, with -2.52dBi gain | | | | | |
| | Right: LDS Antenna, with -1.97dBi gain | | | | | |

Remark:

- 1. For more detailed features description, please refer to the manufacturer's specifications or the User's Manual.
- 2. The EUT battery must be fully charged and checked periodically during the test to ascertain uniform power
- 3. This is provided by the manufacturer. The laboratory is not responsible for technical data provided by the customer

1.4 TEST Standards and Limits

| No. | Identity | Document Title |
|-----|---------------------------|---|
| 1 | FCC 47 CFR Part 2 | Frequency Allocations and Radio Treaty Matters; General Rules and Regulations |
| 2 | ANSI/IEEE Std. C95.1-1992 | IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz |
| 3 | IEC/IEEE 62209-1528:2020 | Measurement procedure for the assessment of specific absorption rate of human exposure to radio frequency fields from hand-held and body-mounted wireless communication devices - Part 1528: Human models, instrumentation, and procedures (Frequency range of 4 MHz to 10 GHz) |
| 4 | FCC KDB 865664 D01 v01r04 | SAR Measurement 100 MHz to 6 GHz |
| 5 | FCC KDB 865664 D02 v01r02 | RF Exposure Reporting |
| 6 | FCC KDB 447498 D04 v01 | Interim General RF Exposure Guidance |

(A). Limits for Occupational/Controlled Exposure (W/kg)

Whole-Body Partial-Body Hands, Wrists, Feet and Ankles

0.4 8.0 20.0

(B). Limits for General Population/Uncontrolled Exposure (W/kg)

Whole-Body Partial-Body Hands, Wrists, Feet and Ankles

0.08 1.6 4.0

NOTE: Whole-Body SAR is averaged over the entire body, partial-body SAR is averaged over any 1 gram of tissue defined as a tissue volume in the shape of a cube. SAR for hands, wrists, feet and ankles is averaged over any 10 grams of tissue defined as a tissue volume in the shape of a cube.

Population/Uncontrolled Environments:

Are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.

Occupational/Controlled Environments:

Are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure, (i.e. as a result of employment or occupation).

NOTE GENERAL POPULATION/UNCONTROLLED EXPOSURE PARTIAL BODY LIMIT 1.6 W/kg

Test Report No.: FCCSZ2025-0008-SAR Page 8 of 35

1.5 Statement of Compliance

The maximum results of Specific Absorption Rate (SAR) found during testing for the EUT are as follows:

| (| | | |
|-----------|------------------------|--|--|
| | Highest Reported | | |
| Mode | Head SAR _{1g} | | |
| | (W/kg) | | |
| Bluetooth | 0.52 | | |

Note:

1. This device is in compliance with Specific Absorption Rate (SAR) for general population/uncontrolled exposure limits (1.6W/kg as averaged over any 1 gram of tissue; 10-gram SAR for Product Specific 10g SAR, limit: 4.0W/kg) specified in FCC 47 CFR part 2 (2.1093) and ANSI/IEEE C95.1-1992 and had been tested in accordance with the measurement methods and procedures specified in IEEE 62209-1528 2020 and FCC KDB publications.

Test Report No.: FCCSZ2025-0008-SAR Page 9 of 35

2 SAR Measurement System

2.1 Definition of Specific Absorption Rate (SAR)

SAR is related to the rate at which energy is absorbed per unit mass in an object exposed to a radio field. The SAR distribution in a biological body is complicated and is usually carried out by experimental techniques or numerical modeling. The standard recommends limits for two tiers of groups, occupational/controlled and general population/uncontrolled, based on a person's awareness and ability to exercise control over his or her exposure. In general, occupational/controlled exposure limits are higher than the limits for general population/uncontrolled.

The SAR definition is the time derivative (rate) of the incremental energy (dW) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dv) of a given density (ρ). The equation description is as below:

$$SAR = \frac{d}{dt} \left(\frac{dW}{dm} \right) = \frac{d}{dt} \left(\frac{dW}{\rho dv} \right)$$

SAR is expressed in units of Watts per kilogram (W/kg) SAR measurement can be related to the electrical field in the tissue by

$$SAR = \frac{\sigma E^2}{\rho}$$

Where: σ is the conductivity of the tissue;

 ρ is the mass density of the tissue and E is the RMS electrical field strength.

2.2 SAR System

DASY System Diagram:

DASY is a system that is able to determine the SAR distribution inside a phantom of human being according to different standards. The DASY system consists of the following items:

Test Report No.: FCCSZ2025-0008-SAR Page 10 of 35

- Main computer to control all the system
- 6 axis robot
- Data acquisition Electronics
- Miniature E-field probe
- Phone holder
- Head simulating tissue

The following figure shows the system.

The EUT under test operating at the maximum power level is placed in the phone holder, under the phantom, which is filled with head simulating liquid. The E-Field probe measures the electric field inside the phantom. The Open SAR software computes the results to give a SAR value in a 1g or 10g mass.

Test Report No.: FCCSZ2025-0008-SAR Page 11 of 35

2.3 Probe

EX3DV4 – Smallest isotropic dosimetric probe for high precision SAR measurements in any exposure scenario (e.g., very strong gradient fields); the only probe that enables compliance testing for frequencies up to 10 GHz with a precision of better than 30%

- Frequency range: 4 MHz – 10 GHz -Dynamic range: 0.01 W/kg – >100 W/kg

-Tip diameter: 2.5 mm -Scanning distance: ≥1.4 mm

Figure 1-Speag COMOSAR Dosimetric E field Dipole

2.4 Date Acquisition Electronics 4 (DAE4)

High precision 3-channel differential voltmeter for use with SPEAG's field, SAR, and temperature probes. Serial optical link for communication with the DASY8 measurement server. Two-step probe touch detector for mechanical surface detection and emergency robot stop.

- Measurement range: -100 +300 mV (16-bit resolution and two range settings: 4 mV, 400 mV)
- Input offset voltage: <5 μV (with auto zero)
- Input resistance: 200 MOhm
- Input bias current: <50 fA
- Battery power: >10 hours of operation (with two 9.6 V NiMH batteries)
- Dimensions (L × W × H): 60 × 60 × 68 mm
- Calibration: ISO/IEC 17025 calibration service available.

Test Report No.: FCCSZ2025-0008-SAR Page 12 of 35

2.4.1 SAM-Twin Phantom

The shell corresponds to the specifications of the Specific Anthropomorphic Mannequin (SAM) phantom defined in IEC/IEEE 62209-1528. It enables the dosimetric evaluation of left and right hand phone usage as well as body-mounted usage at the flat phantom region. A cover prevents evaporation of the liquid. Reference markings on the phantom allow the complete setup of all predefined phantom positions and measurement grids by teaching three points with the robot.SAM-Twin V5.0 and higher has the same shell geometry and is manufactured from the same material as SAM-Twin V4.0 but with reinforced top structure.

- Material: Vinyl ester, fiberglass reinforced (VE-GF)
- Shell Thickness: 2 ± 0.2 mm (6 ± 0.2 mm at ear point)

- Dimensions:Length: 1000 mm Width: 500 mm

Test Report No.: FCCSZ2025-0008-SAR Page 13 of 35

2.4.2 ELI Phantom

The ELI phantom is used for compliance testing of handheld and body-mounted wireless devices in the frequency range of 4 MHz to 10 GHz. ELI is fully compatible with the IEC/IEEE 62209-1528 standard and all known tissue simulating liquids. ELI has been optimized regarding its performance and can be integrated into our standard phantom tables. A cover prevents evaporation of the liquid. Reference markings on the phantom allow installation of the complete setup, including all predefined phantom positions and measurement grids, by teaching three points. The phantom is compatible with all of SPEAG's dosimetric probes and dipoles. The latest ELI V8.0 phantom shell has optimized pretension in the bottom surface during production, such that the phantom is more robust and with reduced sagging.

- Material: Vinyl ester, fiberglass reinforced (VE-GF)
- Shell Thickness:2.0 ± 0.2 mm (bottom plate)
- Dimensions:Major axis: 600 mm, Minor axis: 400 mm
- Filling Volume:approx. 30 liters.

Test Report No.: FCCSZ2025-0008-SAR Page 14 of 35

2.5 WRIST Phantom

The Wrist Phantom V10 is shape-compatible with the CTIA approved OTA GFPC-V1 and optimized for specific absorption rate evaluation of watches and other wireless hand accessories.

- Material: Photosensitive epoxy acrylates
- Shell Thickness:2 ± 0.2 mm
- Wrist Shape:Design compatible with CTIA forearm.

2.6 DEVICE Holder

The SAR in the phantom is approximately inversely proportional to the square of the distance between the source and the liquid surface. For a source at 5 mm distance, a positioning uncertainty of \pm 0.5 mm would produce a SAR uncertainty of \pm 20 %. Accurate device positioning is therefore crucial for accurate and repeatable measurements. The positions in which the devices must be measured are defined by the standards.

Test Report No.: FCCSZ2025-0008-SAR Page 15 of 35

2.7 SYSTEM Validation Dipoles

Symmetrical dipole with I/4 balun. Enables measurement of feed point impedance with NWA. Matched for use near flat phantoms filled with tissue simulating solutions.

- Frequency: 300 MHz to 10 GHz

- Return loss: >20 dB - Power capability: >40 W

Test Report No.: FCCSZ2025-0008-SAR Page 16 of 35

3 TISSUE Simulating Liquids

3.1 SIMULATING Liquids Parameter Check

For SAR measurement of the field distribution inside the phantom, the phantom must be filled with homogeneous tissue simulating liquid to a depth of at least 15 cm. For head SAR testing, the liquid height from the ear reference point (ERP) of the phantom to the liquid top surface is larger than 15 cm. For body SAR testing, the liquid height from the center of the flat phantom to the liquid top surface is larger than 15 cm. The nominal dielectric values of the tissue simulating liquids in the phantom and the tolerance of 5% are listed.

The dielectric properties of the tissue simulating liquids are defined in IEC 62209-1528. The dielectric properties of the tissue simulating liquids were verified prior to the SAR evaluation using a dielectric assessment kit and a network analyzer.

Test Report No.: FCCSZ2025-0008-SAR Page 17 of 35

Dielectric properties of Tissue Simulating Liquid

| Frequency (MHz) | Target Permittivity | Target Conductivity |
|--------------------|------------------------|------------------------|
| 300 | 45.3 | 0.87 |

| 6000 | 35.1 | 5.48 |

Test Report No.: FCCSZ2025-0008-SAR Page 18 of 35

3.2 LIQUIDS Measurement Results

The measuring results for tissue simulating liquid are shown as below.

| Tissue Type | Frequency (MHz) | Measured Conductivity (σ) | Measured Permittivity (ε _r) | Target Conductivity (σ) | Target Permittivity (ε _r) | Conductivity Deviation (%) | Permittivity Deviation (%) | Test Date |
|----------------|--------------------|---------------------------------|---|-------------------------------|---|----------------------------------|----------------------------------|---------------|
| H2450 | 2450 | 1.850 | 39.500 | 1.80 | 39.20 | 2.78 | 0.77 | Feb. 14, 2025 |

Note:

- 1. The dielectric properties of the tissue simulating liquid must be measured within 24 hours before the SAR testing and within ±5% of the target values. Liquid temperature during the SAR testing must be within ±2 °C
- 2. Since the maximum deviation of dielectric properties of the tissue simulating liquid is within 5%.

Test Report No.: FCCSZ2025-0008-SAR Page 19 of 35

4 SAR System Validation

4.1 VALIDATION System

Each DASY system is equipped with one or more system validation kits. These units, together with the predefined measurement procedures within the DASY software, enable the user to conduct the system performance check and system validation. System kit includes a dipole, and dipole device holder.

The system check verifies that the system operates within its specifications. It's performed daily or before every SAR measurement. The system check uses normal SAR measurement in the flat section of the phantom with a matched dipole at a specified distance. The system validation setup is shown as below.

Test Report No.: FCCSZ2025-0008-SAR Page 20 of 35

4.2 SYSTEM Validation Result

The measuring result for system verification is tabulated as below.

| Test Date | Frequency (MHz) | 1W Target SAR-1g (W/kg) | Measured SAR-1g (W/kg) | Normalized to 1W SAR-1g (W/kg) | Deviation (%) | Dipole S/N | Probe S/N | DAE S/N |
|---------------|--------------------|-------------------------------|------------------------------|---|------------------|---------------|--------------|------------|
| Feb. 14, 2025 | 2450 | 51.40 | 5.41 | 54.10 | 5.25 | 1081 | 7628 | 1557 |

Note:

Comparing to the reference SAR value provided by SPEAG, the validation data should be within its specification of 10 %. The result indicates the system check can meet the variation criterion and the plots can be referred to Appendix A of this report.

Test Report No.: FCCSZ2025-0008-SAR Page 21 of 35

5 SAR Evaluation Procedures

To evaluate the peak spatial-average SAR values with respect to 1 g or 10 g cubes, fine resolution volume scans, called zoom scans, are performed at the peak SAR locations identified during the area scan. If the cube volume within the zoom scan chosen to calculate the peak spatial-average SAR touches any boundary of the zoom-scan volume, the zoom scan shall be repeated with the center of the zoom-scan volume shifted to the new maximum SAR location. For any secondary peaks found in the area scan that are within 2 dB of the maximum peak and are not within this zoom scan, the zoom scan shall be performed for such peaks, unless the peak spatial-average SAR at the location of the maximum peak is more than 2 dB below the applicable SAR limit (i.e., 1 W/kg for a 1.6 W/kg 1 g limit, or 1.26 W/kg for a 2 W/kg 10 g limit). The zoom scan resolutions specified in the table below must be applied to the SAR measurements.

Table 3 - Area scan parameters

| Parameter | DUT transmit frequency being tested | | | | |
|--|---|--|--|--|--|
| r arameter | f≤ 3 GHz | 3 GHz <f≤ 10="" ghz<="" th=""></f≤> | | | |
| Maximum distance between the measured points (geometric centre of the sensors) and the inner phantom surface (z_{M1} in Figure 20 in mm) | 5 ± 1 | δ ln(2)/2 ± 0,5° | | | |
| Maximum spacing between adjacent measured points in mm (see $\frac{\text{O.8.3.1}}{\text{O.8.3.1}}$) b | 20, or half of the corresponding zoom scan length, whichever is smaller | 60/f, or half of the corresponding zoom scan length,whichever is smaller | | | |
| Maximum angle between the probe axis and the phantom surface normal (a in Figure 20)° | 5° (flat phantom only) 30° (other phantoms) | 5° (flat phantom only) 20° (other phantoms) | | | |
| Tolerance in the probe angle | 1° | 1° | | | |

a $\,\delta$ is the penetration depth for a plane-wave incident normally on a planar half-space.

b See Clause 0.8 on how Δx and Δy may be selected for individual area scan requirements.

c The probe angle relative to the phantom surface normal is restricted due to the degradation in the measurement accuracy in fields with steep spatial gradients. The measurement accuracy decreases with increasing probe angle and increasing frequency. This is the reason for the tighter probe angle restriction at frequencies above 3 GHz.

Test Report No.: FCCSZ2025-0008-SAR Page 22 of 35

Table 4 - Zoom scan parameters

| Parameter | DUT transmit frequency being tested | | | |
|---|-------------------------------------|-------------------------------------|--|--|
| raiametei | f≤ 3 GHz | 3 GHz <f≤ 10="" ghz<="" th=""></f≤> | | |
| Maximum distance between the closest | | | | |
| measured points and the phantom surface | 5 | $\delta \ln(2)/2 \pm 0.5^{a}$ | | |
| (z _{M1} in Figure 20 and Table 3, in mm) | | | | |
| Maximum angle between the probe axis and the phantom | 5° (flat phantom only) | 5° (flat phantom only) | | |
| surface normal (α in Figure 20) | 30° (other phantoms) | 20° (other phantoms) | | |
| Maximum spacing between measured points in the x- and y-directions (Δx and Δy , in mm) | 8 | 24/f b | | |
| For uniform grids: | | | | |
| Maximum spacing between measured points in the direction normal to the phantom shell | 5 | 10/(f - 1) | | |
| (Δ z₁ in Figure 20, in mm) | | | | |
| For graded grids: | | | | |
| Maximum spacing between the two closest | 4 | 12/f | | |
| measured points in the direction normal to the phantom shell $(\Delta z_1$ in Figure 20, in mm) | <u> </u> | 12/1 | | |
| For graded grids: | | | | |
| Maximum incremental increase in the spacing | 1,5 | 1,5 | | |
| between measured points in the direction normal to the phantom shell ($R_z = \Delta z_2/\Delta z_1$ in Figure 20) | 1,0 | 1,0 | | |
| Minimum edge length of the zoom scan volume in the x- and y-directions (L_z , in <u>O.8.3.2</u> , in mm) | 30 | 22 | | |
| Minimum edge length of the zoom scan volume in the direction normal to the phantom shell (L _h in <u>O.8.3.2</u> in mm) | 30 | 22 | | |
| Tolerance in the probe angle | 1° | 1° | | |

a $\,\delta$ is the penetration depth for a plane-wave incident normally on a planar half-space.

b This is the maximum spacing allowed, which might not work for all circumstances.

Test Report No.: FCCSZ2025-0008-SAR Page 23 of 35

6 SAR Measurement Evaluation

6.1 EUT Configuration and Setting

<Considerations Related to Bluetooth for Setup and Testing>

This device has installed Bluetooth engineering testing software which can provide continuous transmitting RF signal. During Bluetooth SAR testing, this device was operated to transmit continuously at the maximum transmission duty with specified transmission mode, operating frequency, lowest data rate, and maximum output power.

Test Report No.: FCCSZ2025-0008-SAR Page 24 of 35

6.2 EUT Testing Position

6.2.1 Head mounted Device(Headset)

- (a) To position the device parallel to the phantom surface with inner and outside surfaces of the device.
- (b) To adjust the device parallel to the flat phantom.
- (c) To adjust the distance between the device surface and the flat phantom to 0mm.

Test Report No.: FCCSZ2025-0008-SAR Page 25 of 35

7 Maximum Output Power

7.1 Maximum Conducted Power

The maximum conducted average power (Unit: dBm) including tune-up tolerance is shown as below. <Left ear>

| Mode | 2.4G Bluetooth |
|-----------|----------------|
| GFSK | 4.0 |
| π/4-DQPSK | 0.5 |
| 8DPSK | 0.5 |
| LE 1M | 3.5 |

<Right ear>

| Mode | 2.4G Bluetooth |
|-----------|----------------|
| GFSK | 4.5 |
| π/4-DQPSK | 1.0 |
| 8DPSK | 1.0 |
| LE 1M | 4.0 |

7.2 Duty Cycle

General Note:

The Bluetooth duty cycle are 57.6% for left ear & right ear as following figure, according to Oct. 2016 TCBworkshop for Bluetooth SAR scaling need further consideration and the maximum duty cycle is 100%, thereforethe actual duty cycle will be scaled up to 100% for Bluetooth reported SAR calculation.

8 SAR Testing Results

8.1 SAR Test Reduction Considerations

<KDB 447498 D01, General RF Exposure Guidance>

Testing of other required channels within the operating mode of a frequency band is not required when the reported SAR for the mid-band or highest output power channel is:

- (1) ≤ 0.8 W/kg or 2.0 W/kg, for 1-g or 10-g respectively, when the transmission band is ≤ 100 MHz
- (2) ≤ 0.6 W/kg or 1.5 W/kg, for 1-g or 10-g respectively, when the transmission band is between 100 MHz and 200 MHz
- (3) ≤ 0.4 W/kg or 1.0 W/kg, for 1-g or 10-g respectively, when the transmission band is ≥ 200 MHz

Note: The reported SAR was scaled to 57.6% transmission duty factor to determine compliance since the duty factor of the device is permanently limited to 57.6% per the manufacturer

Test Report No.: FCCSZ2025-0008-SAR Page 30 of 35

8.3 SAR Measurement Variability

According to KDB 865664 D01, SAR measurement variability was assessed for each frequency band, which is determined by the SAR probe calibration point and tissue-equivalent medium used for the device measurements. When both head and body tissue-equivalent media are required for SAR measurements in a frequency band, the variability measurement procedures should be applied to the tissue medium with the highest measured SAR, using the highest measured SAR configuration for that tissue-equivalent medium. Alternatively, if the highest measured SAR for both head and body tissue-equivalent media are ≤ 1.45 W/kg and the ratio of these highest SAR values, i.e., largest divided by smallest value, is ≤ 1.10 , the highest SAR configuration for either head or body tissue-equivalent medium may be used to perform the repeated measurement. These additional measurements are repeated after the completion of all measurements requiring the same head or body tissue-equivalent medium in a frequency band. The test device should be returned to ambient conditions (normal room temperature) with the battery fully charged before it is re-mounted on the device holder for the repeated measurement(s) to minimize any unexpected variations in the repeated results.

Since all the measured SAR are less than 0.8 W/kg, the repeated measurement is not required.
