

Equipment : High Power AC2600 Wi-Fi Router

Brand Name : Amped Wireless

Model No. : RTA2600

FCC ID : ZTT-RTA2600

Standard : 47 CFR FCC Part 15.247 Operating Band : 2400 MHz – 2483.5 MHz

FCC Classification: DTS

Applicant : Amped Wireless

13089 Peyton Dr. #C307 Chino Hills CA 91709

Manufacturer : EDIMAX TECHNOLOGY CO., LTD.

No.3, Wu-Chuan 3rd Road, Wu-Ku Industrial Park,

New Taipei City, Taiwan

The product sample received on Apr. 02, 2015 and completely tested on May 06, 2015. We, SPORTON, would like to declare that the tested sample has been evaluated in accordance with the procedures given in ANSI C63.10-2009 and shown compliance with the applicable technical standards.

The test results in this report apply exclusively to the tested model / sample. Without written approval of SPORTON INTERNATIONAL INC., the test report shall not be reproduced except in full.

- Note 1: RF output power specifies that Maximum Peak Conducted Output Power.
- Note 2: 802.11b uses a combination of DSSS-DBPSK, DQPSK, CCK modulation.
- Note 3: 802.11g/n uses a combination of OFDM-BPSK, QPSK, 16QAM, 64QAM modulation.
- Note 4: Co-location, Co-location is generally defined as simultaneously transmitting (co-transmitting) antennas within 20 cm of each other. (i.e., EUT has simultaneously co-transmitting that operating 2.4GHz and 5GHz.)

#### 1.1.2 Antenna Information

|             | For         | conducted measurement.  |
|             |             | The EUT supports single transmit chain and measurements performance on this transmit chain.   |
|             |             | The EUT supports diversity transmitting and the results on transmit chain port 1 is the worst case.   |
|             | $\boxtimes$ | The EUT supports multiple transmit chains using options given below: Refer as FCC KDB 662911, In-band power measurements. Using the measure-and-sum approach, measured all transmit ports individually. Sum the power (in linear power units e.g., mW) of all ports for each individual sample and save them. |
|             | $\boxtimes$ | If multiple transmit chains, EIRP calculation could be following as methods: $P_{total} = P_1 + P_2 + + P_n$ (calculated in linear unit [mW] and transfer to log unit [dBm]) EIRP <sub>total</sub> = $P_{total} + DG$   |

|             |   | Refer as FCC KDB 558074, clause 10.5 Method AVGPSD-2 (spectral trace averaging).   |  |  |  |  |  |  |  |
|             |   | Refer as FCC KDB 558074, clause 10.6 Method AVGPSD-2 Alt. (slow sweep speed)   |  |  |  |  |  |  |  |
| $\boxtimes$ | For   | conducted measurement.   |  |  |  |  |  |  |  |
|             |   | The EUT supports single transmit chain and measurements performed on this transmit chain.  |  |  |  |  |  |  |  |
|             |   | The EUT supports diversity transmitting and the results on transmit chain port 1 is the worst case.  |  |  |  |  |  |  |  |
|             | $\boxtimes$   | The EUT supports multiple transmit chains using options given below:   |  |  |  |  |  |  |  |
|             |   | Option 1: Measure and sum the spectra across the outputs. Refer as FCC KDB 662911, In-band power spectral density (PSD). Sample all transmit ports simultaneously using a spectrum analyzer for each transmit port. Where the trace bin-by-bin of each transmit port summing can be performed. (i.e., in the first spectral bin of output 1 is summed with that in the first spectral bin of output 2 and that from the first spectral bin of output 3, and so on up to the N <sub>TX</sub> output to obtain the value for the first frequency bin of the summed spectrum.). Add up the amplitude (power) values for the different transmit chains and use this as the new data trace. |  |  |  |  |  |  |  |
|             |   | Option 2: Measure and add 10 log(N) dB, where N is the number of transmit chains. Refer as FCC KDB 662911, In-band power spectral density (PSD). Performed at each transmit chains and each transmit chains shall be compared with the limit have been reduced with 10 log(N). Or each transmit chains shall be add 10 log(N) to compared with the limit.  |  |  |  |  |  |  |  |

Report No.: FR530939AC

Note 1: Test distance for frequencies at or above 30 MHz, measurements may be performed at a distance other than the limit distance provided they are not performed in the near field and the emissions to be measured can be detected by the measurement equipment. When performing measurements at a distance other than that specified, the results shall be extrapolated to the specified distance using an extrapolation factor of 20 dB/decade (inverse of linear distance for field-strength measurements, inverse of linear distance-squared for power-density measurements).

Note 2: Test distance for frequencies at below 30 MHz, measurements may be performed at a distance closer than the EUT limit distance; however, an attempt should be made to avoid making measurements in the near field. When performing measurements below 30 MHz at a closer distance than the limit distance, the results shall be extrapolated to the specified distance by either making measurements at a minimum of two or more distances on at least one radial to determine the proper extrapolation factor or by using the square of an inverse linear distance extrapolation factor (40 dB/decade). The test report shall specify the extrapolation method used to determine compliance of the EUT.

| Un-restricted Band Emissions Limit |            |  |  |  |  |  |  |
|------------------------------------|------------|--|--|--|--|--|--|
| RF output power procedure          | Limit (dB) |  |  |  |  |  |  |
| Peak output power procedure        | 20         |  |  |  |  |  |  |
| Average output power procedure     | 30         |  |  |  |  |  |  |

Note 1: If the peak output power procedure is used to measure the fundamental emission power to demonstrate compliance to requirements, then the peak conducted output power measured within any 100 kHz outside the authorized frequency band shall be attenuated by at least 20 dB relative to the maximum measured in-band peak PSD level.

Note 2: If the average output power procedure is used to measure the fundamental emission power to demonstrate compliance to requirements, then the power in any 100 kHz outside of the authorized frequency band shall be attenuated by at least 30 dB relative to the maximum measured in-band average PSD level.

#### 3.6.4 Test Setup

Report No.: FR530939AC

Magnetic field tests shall be performed in the frequency range of 9 kHz to 30 MHz using a calibrated loop antenna. Electric field tests shall be performed in the frequency range of 30 MHz to 1000 MHz using a calibrated bi-log antenna.

# Semi Anechoic Chamber Radio Absorbing Material Absorbing Max. 0.3m Metal Ground Plane Semi Anechoic Chamber Absorbing Max. 0.4m Spectrum Analyzer

Electric field tests shall be performed in the frequency range of 1 GHz to 10th harmonic of highest fundamental frequency or 40 GHz using a calibrated horn antenna.

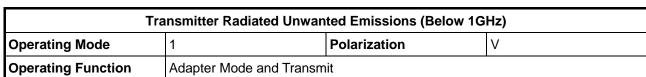

Note: FCC's permission to use 1.5m as an alternative per TCBC Conf call of Dec. 02, 2014.

#### 3.6.5 Transmitter Radiated Unwanted Emissions (Below 30MHz)

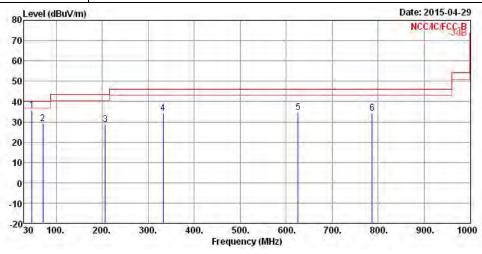

All amplitude of spurious emissions that are attenuated by more than 20 dB below the permissible value has no need to be reported.

- Note 1: ">20dB" means spurious emission levels that exceed the level of 20 dB below the applicable limit.
- Note 2: "N/F" means Nothing Found spurious emissions (No spurious emissions were detected.)
- Note 3: Measurement receive antenna polarization: H (Horizontal), V (Vertical)
- Note 4: For restricted bands, the peak measurement is fully sufficient, as the max field strength as measured with the Peak-Detector meets the AV-Limit so that the AV level does not need to be reported in addition.
- Note 5: For un-restricted bands, unwanted emissions shall be attenuated by at least 20 dB relative to the maximum measured in-band level (118.88 dBuV/m).
- Note 6: No level of unwanted emissions exceeds the level of the fundamental emission.

- Note 2: "N/F" means Nothing Found spurious emissions (No spurious emissions were detected.)
- Note 3: Measurement receive antenna polarization: H (Horizontal), V (Vertical)
- Note 4: For restricted bands, the peak measurement is fully sufficient, as the max field strength as measured with the Peak-Detector meets the AV-Limit so that the AV level does not need to be reported in addition.
- Note 5: For un-restricted bands, unwanted emissions shall be attenuated by at least 20 dB relative to the maximum measured in-band level (124.63 dBuV/m).
- Note 6: No level of unwanted emissions exceeds the level of the fundamental emission.

- Note 1: ">20dB" means spurious emission levels that exceed the level of 20 dB below the applicable limit.
- Note 2: "N/F" means Nothing Found spurious emissions (No spurious emissions were detected.)
- Note 3: Measurement receive antenna polarization: H (Horizontal), V (Vertical)
- Note 4: For restricted bands, the peak measurement is fully sufficient, as the max field strength as measured with the Peak-Detector meets the AV-Limit so that the AV level does not need to be reported in addition.
- Note 5: For un-restricted bands, unwanted emissions shall be attenuated by at least 20 dB relative to the maximum measured in-band level (112.54 dBuV/m).
- Note 6: No level of unwanted emissions exceeds the level of the fundamental emission.

- Note 1: ">20dB" means spurious emission levels that exceed the level of 20 dB below the applicable limit.
- Note 2: "N/F" means Nothing Found spurious emissions (No spurious emissions were detected.)
- Note 3: Measurement receive antenna polarization: H (Horizontal), V (Vertical)
- Note 4: For restricted bands, the peak measurement is fully sufficient, as the max field strength as measured with the Peak-Detector meets the AV-Limit so that the AV level does not need to be reported in addition.
- Note 5: For un-restricted bands, unwanted emissions shall be attenuated by at least 20 dB relative to the maximum measured in-band level (114.94 dBuV/m).
- Note 6: No level of unwanted emissions exceeds the level of the fundamental emission.
