

According to KDB 447498 D01 v06 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance ≤ 50 mm are determined by:

$$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] \leq 3.0$$

The tune-up power is -0.98 dBm +/- 0dB, therefore the highest tune-up power is

$$\mathbf{-0.98 \text{ dBm} \quad (0.7980 \text{ mW}) \quad @ 2441 \text{ MHz}}$$

When the minimum *test separation distance* is < 5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

So,

$$(\mathbf{0.7980 \text{ mW}} / 5 \text{ mm}) \cdot (\mathbf{2.441 \text{ GHz}}^{0.5}) = 0.249$$

$$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] = 0.249 < 3.0$$

Therefore, SAR are not required
