RE: Zebra Technologies Corporation

FCC ID: I28MD-ZLAN11B

I have a few comments on this Application.

1. We have the same concerns with this application as with the earlier application only the gain has increases by almost 3 dB. The RF exposure and grant notes cite 2.5 cm. The power is 45 mw, antenna gain almost 3.5 dB. By definitions provided to us, this would require SAR since exclusions only cite 49 mW for > 2.5 cm and this would be 100 mW. We MUST look at worse case of Conducted and EIRP. Therefore SAR evaluation must be performed. Please submit a SAR evaluation.

Response: As with the earlier application, despite the antenna specifications supplied by the manufacturer, measured EIRP for the CQ17718-G1 antenna was 0.8 mW and for the CQ17718-G2 antenna was 1.6 mW. The test setup was again verified as with the earlier application (a test was run using the EUT and horn antenna). The measured EIRP with the horn antenna was what was expected based on the conducted power and horn gain. This test verified the test setup and EUT. The lower antenna gain of the EUT antenna in actual use is attributed to the inclusion of the antenna cable which includes a ferrite. This ferrite was added during testing for the original certification to mitigate failing spurious emissions. This ferrite is also attenuating in-band signals. Therefore, based on the conducted power and the two measured EIRP values, we feel that the EUT continues to meet the requirements of the TCB exclusion list.

Thank you,  
Douglas E. Noble  
Examining Engineer
