

# 5.9 Spurious RF Conducted Emissions

| Test Requirement:      | 47 CFR Part 15C Section 15.247 (d)  |
|------------------------|---|
| Test Method:           | ANSI C63.10:2013  |
| Test Setup:            | Spectrum Analyzer<br>E.U.T<br>Non-Conducted Table<br>Ground Reference Plane   |
|                        | Remark: Offset=cable loss+ attenuation factor.  |
| Limit:                 | In any 100 kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement. |
| Exploratory Test Mode: | Non-hopping transmitting with all kind of modulation and all kind of data type  |
| Final Test Mode:       | Through Pre-scan, find the DH5 of data type is the worst case of GFSK modulation type, 2-DH5 of data type is the worst case of $\pi$ /4DQPSK modulation type, 3-DH5 of data type is the worst case of 8DPSK modulation type.  |
| Test Results:          | Pass  |

## Shenzhen Huaxia Testing Technology Co., Ltd.

Report No.: CQASZ20250100113E-02

### Remark:

Pre test 9kHz to 25GHz, find the highest point when testing, so only the worst data were shown in the test report. Per FCC Part 15.33 (a) and 15.31 (o) ,The amplitude of spurious emissions from intentional radiators which are attenuated more than 20 dB below the permissible value need not be reported unless specifically required elsewhere in this part.

| According to Bluetooth Core bandwidths that match the   | on the average by each transmitter.<br>Specification, Bluetooth receivers are designed to have input and IF<br>hopping channel bandwidths of any Bluetooth transmitters and shift<br>on with the transmitted signals.   |  |  |  |  |  |  |  |
| Compliance for section 15.  | 247(g)  |  |  |  |  |  |  |  |
| pseudorandom hopping frequence  | e Specification, the Bluetooth system transmits the packet with the<br>uency with a continuous data and the short burst transmission from the<br>nsmitted under the frequency hopping system with the pseudorandom  |  |  |  |  |  |  |  |

### Compliance for section 15.247(h)

According to Bluetooth Core specification, the Bluetooth system incorporates with an adaptive system to detect other user within the spectrum band so that it individually and independently to avoid hopping on the occupied channels.

According to the Bluetooth Core specification, the Bluetooth system is designed not have the ability to coordinated with other FHSS System in an effort to avoid the simultaneous occupancy of individual hopping frequencies by multiple transmitter.

|                   | Above 1GHz         500         54.0         Average         3   |            |                                |                   |            |                          |   |  |
|                   | Note: 15.35(b), Unless otherwise specified, the limit on peak radio frequency<br>emissions is 20dB above the maximum permitted average emission limit<br>applicable to the equipment under test. This peak limit applies to the tota<br>peak emission level radiated by the device. |            |                                |                   |            |                          |   |  |

|                        | d. For each suspected emission, the EUT was arranged to its worst case<br>and then the antenna was tuned to heights from 1 meter to 4 meters (for<br>the test frequency of below 30MHz, the antenna was tuned to heights 1<br>meter) and the rotatable table was turned from 0 degrees to 360<br>degrees to find the maximum reading.  |
|------------------------|--|
|                        | e. The test-receiver system was set to Peak Detect Function and Specified<br>Bandwidth with Maximum Hold Mode.   |
|                        | <ul> <li>f. If the emission level of the EUT in peak mode was 10dB lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions that did not have 10dB margin would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet.</li> <li>g. Test the EUT in the lowest channel (2402MHz), the middle channel (2441MHz), the Highest channel (2480MHz)</li> </ul> |
|                        | <ul> <li>h. The radiation measurements are performed in X, Y, Z axis positioning<br/>for Transmitting mode, and found the X axis positioning which it is the<br/>worst case.</li> </ul>  |
|                        | i. Repeat above procedures until all frequencies measured was complete.  |
| Exploratory Test Mode: | Non-hopping transmitting mode with all kind of modulation and all kind of<br>data type<br>Transmitting mode  |
| Final Test Mode:       | Only the worst case is recorded in the report.   |
| Test Results:          | Pass   |

## 5.11.1 Radiated Emission below 1GHz

Remark:

The field strength is calculated by adding the Antenna Factor, Cable Factor & Preamplifier. The basic equation with a sample calculation is as follows:

Factor= Antenna Factor + Cable Factor - Preamplifier Factor,

Level = Read Level + Factor,

Over Limit=Level-Limit Line.
