2 **Operational States**

Description of function of the EUT:

The EUT is a RFID reader to be installed into a forklift. The reader grants access to the forklift when the correct TAG is placed in front of the reader. The EUT is operating at 125 kHz and 13.56 MHz. Both operating frequencies get toggled cyclically but only one frequency is active at a time.

For each test case, two operation modes were tested. The EUT was reading either a 125 kHz or a 13.56 MHz TAG which was placed in front of the EUT. The radiated emissions from 30 MHz to 1 GHz were additionally measured without placing a TAG in front of the EUT.

The following states were defined as the operating conditions:

The EUT was supplied with 24 V DC via a battery.

The EUT was set up as follows:

3 Additional Information

The EUT was not labeled as required by FCC / IC.

As declared by the applicant, the EUT gets installed into a forklift (vehicular use) and is not operative when the forklift gets charged / is connected to a public power supply. Therefore, no conducted emissions tests on the supply line were carried out.

4 Overview

**: Integrated antenna only, requirement fulfilled.

5 Results

5.1 99 % bandwidth

5.1.1 Test method

The following procedure will be used for the occupied bandwidth measurement according to [1]:

The occupied bandwidth is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers are each equal to 0.5% of the total mean power of the given emission. The following procedure shall be used for measuring 99% power bandwidth:

- a) The instrument center frequency is set to the nominal EUT channel center frequency. The frequency span for the spectrum analyzer shall be between 1.5 times and 5.0 times the OBW.
- b) The nominal IF filter bandwidth (3 dB RBW) shall be in the range of 1% to 5% of the OBW and the VBW shall be approximately three times the RBW, unless otherwise specified by the applicable requirement.
- c) Set the reference level of the instrument as required, keeping the signal from exceeding the maximum input mixer level for linear operation. In general, the peak of the spectral envelope shall be more than [10 log (OBW/RBW)] below the reference level. Specific guidance is given in 4.1.5.2.
- d) Step a) through step c) might require iteration to adjust within the specified range.

Test equipment (please refer to chapter 6 for details) 1, 2

5.2 Radiated emissions

5.2.1 Test method

The radiated emission measurement is subdivided into three stages.

- A preliminary measurement carried out in a fully anechoic chamber with a fixed antenna height in the frequency range 9 kHz to 30 MHz.
- A final measurement carried out on an outdoor test side without reflecting ground plane and a fixed antenna height in the frequency range 9 kHz to 30 MHz.
- A preliminary and final measurement carried out in a semi anechoic chamber with a varying antenna height in the frequency range 30 MHz to 1 GHz.

Preliminary measurement (9 kHz to 30 MHz):

In the first stage a preliminary measurement will be performed in a semi-anechoic chamber with a measuring distance of 3 meters. Table-top devices are set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices will be placed directly on the turntable/ground plane. The setup of the Equipment under test will be in accordance to [1].

The frequency range 9 kHz to 30 MHz will be monitored with an EMI receiver while the system and its cables will be manipulated to find out the configuration with the maximum emission levels if applicable. The EMI receiver will be set to MAX Hold mode. The EUT and the measuring antenna will be rotated around their vertical axis to find the maximum emissions.

The resolution bandwidth of the EMI receiver will be set to the following values:

Frequency range	Resolution bandwidth
9 kHz to 150 kHz	200 Hz
150 kHz to 30 MHz	9 kHz

Preliminary measurement procedure (9 kHz to 30 MHz):

Pre-scans were performed in the frequency range 9 kHz to 150 kHz and 150 kHz to 30 MHz.

The following procedure will be used:

- 1) Monitor the frequency range at horizontal polarisation and a EUT azimuth of 0 °.
- 2) Manipulate the system cables within the range to produce the maximum level of emission.
- 3) Rotate the EUT by 360 ° to maximize the detected signals.
- 4) Make a hardcopy of the spectrum.
- 5) Repeat steps 1) to 4) with the other orthogonal axes of the EUT (if the EUT is a module and might be used in a handheld equipment application).
- 6) Rotate the measuring antenna and repeat steps 1) to 4).

Final measurement (9 kHz to 30 MHz):

In the second stage a final measurement will be performed on an open area test site with no conducting ground plane in a measuring distance of 3 m. In the case where larger measuring distances are required the results will be extrapolated based on the values measured on the closer distances according to Section 15.31 (f) (2) [2]. The final measurement will be performed with an EMI Receiver set to Quasi Peak detector except for the frequency bands 9 kHz to 90 kHz and 110 kHz to 490 kHz where an Average detector will be used according Section 15.209 (d) [2].

At the frequencies, which were detected during the preliminary measurements, the final measurement will be performed while rotating the EUT and the measuring antenna in the range of 0 ° to 360 ° around their vertical axis until the maximum value is found.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
9 kHz to 150 kHz	200 Hz
150 kHz to 30 MHz	9 kHz

Final measurement procedure (9 kHz to 30 MHz):

The following procedure will be used:

- 1) Monitor the frequencies with the measuring antenna at vertical orientation parallel to the EUT at an azimuth of 0 °.
- 2) Rotate the EUT by 360 ° to maximize the detected signals and note the azimuth and orientation.
- 3) Rotate the measuring antenna to find the maximum and note the value.
- 4) Rotate the measuring antenna and repeat steps 1) to 3) until the maximum value is found.
- 5) Repeat steps 1) to 4) with the other orthogonal axes of the EUT (if the EUT is a module and might be used in a handheld equipment application).

Preliminary and final measurement (30 MHz to 1 GHz)

The preliminary and final measurements were conducted in a semi-anechoic chamber with a metal ground plane. During the test the EUT will be rotated in the range of 0 ° to 360 °, the measuring antenna will be set to horizontal and vertical polarization and raised and lowered in the range from 1 m to 4 m to find the maximum level of emissions.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Test	Frequency range	Resolution bandwidth
Preliminary measurement	30 MHz to 1 GHz	100 kHz
Frequency peak search	+ / - 1 MHz	10 kHz
Final measurement	30 MHz to 1 GHz	120 kHz

Preliminary measurement procedure (30 MHz to 1 GHz):

The following procedure is used:

- 1. Set the measurement antenna to 1 m height.
- 2. Monitor the frequency range at vertical polarisation and a EUT azimuth of 0 °.
- 3. Rotate the EUT by 360° to maximize the detected signals.
- 4. Repeat 1) to 3) with the horizontal polarisation of the measuring antenna.
- 5. Increase the height of the antenna for 0.5 m and repeat steps 2 4 until the final height of 4 m is reached.
- 6. The highest values for each frequency will be saved by the software, including the antenna height, measurement antenna polarization and turntable azimuth for that value.

Final measurement procedure (30 MHz to 1 GHz):

The following procedure is used:

- 1. Select the highest frequency peaks (smallest margin to the limit) for the final measurement.
- 2. The software will determine the exact peak frequencies by doing a partial scan with reduced RBW with +/-10 times the RBW of the pre-scan of the selected peaks.
- 3. If the EUT is portable or ceiling mounted, find the worst case EUT position (x,y,z) for the final test.
- 4. The measurement antenna height resulting in the highest emission level is found by the software by varying the measurement antenna height by +/- 0.5 m from the value obtained in the preliminary measurement.
- 5. The azimuth turntable position resulting in the highest emission level is found by varying the turntable azimuth by +/- 30° from the value obtained in the preliminary measurement.
- 6. The final measurement is performed at the worst-case antenna height and the worst-case turntable position.
- 7. Steps 2 6 will be repeated for each frequency peak selected in step 1.

5.2.2 Results preliminary measurement 9 kHz to 30 MHz

Remark: The emissions were independent of the used TAG, therefore only one result is shown (reading 13.56 MHz TAG).

The following emission was found according to [2] and [3] (fundamental of transmitters): 131 kHz, 13.56 MHz.

The following frequencies were found outside and inside the restricted bands according to FCC 47 CFR Part 15 section 15.209.

These frequencies must be measured with in a final measurement.

Frequency in MHz						
0.010	0.392					
0.029	0.654					
0.058	15.947					
0.299	21.880

Note: *Result @ norm dist. = Reading + Antenna factor - Distance correction factor; Result $[dB\mu A/m] = Result [dB\mu V/m] - 20*log(377 \Omega)$

** Margin = Limit [dBµ{V|A}/m] - Result @ norm dist.

*** 40dB/decade according Part §15.31 (f) (2)

*1 The emission could not be measured at the OATS due to environmental disturbances. Therefore, the maximum peak value determined in the preliminary measurement is taken as the final result.

Remark: The limits in CFR 47, Part 15, Subpart C, paragraph 15.209(a), are identical to those in RSS-Gen section 8.9, Table 6, since the measurements are performed in terms of magnetic field strength and converted to electric field strength levels (as reported in the table) using the free space impedance of 377 Ohms.

Test: Passed

Test equipment (please refer to chapter 6 for details) 3, 13, 14

5.2.4 Results preliminary and final measurement 30 MHz to 1 GHz

Remark: Only the plot for the worst-case mode is shown (reading a 13.56 MHz TAG). Remark: The EUT was only measured in one orientation, according to the usage position, as defined by the applicant.

52.290000	35.49	40.00	4.51	1000.0	120.000	100.0	V	90.0	16.0
162.740000	32.07	43.52	11.45	1000.0	120.000	238.0	Н	274.0	18.2
Measurement uncertainty: ± 4.78 dB									

Operation mode: Reading a 125 kHz TAG

Operation mode: Awaiting a TAG

Frequency (MHz)	QuasiPeak (dBµV/m)	Limit (dBµV/m)	Margin (dB)	Meas. Time (ms)	Bandwidth (kHz)	Height (cm)	Pol	Azimuth (deg)	Corr. (dB)
40.690000	37.61	40.00	2.39	1000.0	120.000	100.0	V	74.0	23.4
48.000000	32.64	40.00	7.36	1000.0	120.000	100.0	V	-8.0	18.9
53.030000	36.68	40.00	3.32	1000.0	120.000	100.0	V	4.0	15.5
162.740000	32.48	43.52	11.04	1000.0	120.000	237.0	Н	274.0	18.2
Measurement uncertainty: ± 4.78 dB									

The correction factor was calculated as follows.

Corr. (dB) = cable attenuation (dB) + 6 dB attenuator (dB) + antenna factor (dB)

Therefore, the reading can be calculated as follows:

Reading (dBµV/m) = result QuasiPeak (dBµV/m) - Corr. (dB)

Test: Passed

Test equipment (please refer to chapter 6 for details) 4 - 12

6 Test Equipment used for Tests

No.	Test equipment	Туре	Manufacturer	Serial No.	PM. No.	Cal. Date	Cal Due
1	Signal & Spectrum Analyzer	FSW43	Rohde & Schwarz	100586 & 100926	481720	04.03.2020 03.2022	
2	Loop antenna	Loop antenna 22.5cm	PHOENIX TESTLAB GmbH	-	410085	Calibration not	necessary
3	Loop antenna	HFH2-Z2	Rohde & Schwarz	832609/014	480059	14.02.2020 02.2022	
4	Attenuator 6 dB	WA2-6	Weinschel	8254	410119	Calibration not	necessary
5	Antenna (Bilog)	CBL6111D	Schaffner	25761	480894	09.10.2020	10.2023
6	Software	EMC32	Rohde & Schwarz	100970	482972	Calibration not	necessary
7	RF switch matrix	OSP220	Rohde & Schwarz		482976	Calibration not	necessary
8	Turntable	TT3.0-3t	Maturo	825/2612/.01	483224	Calibration not	necessary
9	Antenna support	BAM 4.5-P-10kg	Maturo	222/2612.01	483225	Calibration not	necessary
10	Controller	NCD	Maturo	474/2612.01	483226	Calibration not	necessary
11	Anechoic chamber M276	SAC5-2	Albatross Projects	C62128-A540- A138-10-0006	483227	Calibration not	necessary
12	EMI Receiver / Spectrum Analyser	ESW44	Rohde & Schwarz	101828	482979	14.11.2019	11.2021
13	Outdoor test site	-	PHOENIX TESTLAB GmbH	-	480293	Calibration not necessary	
14	EMI Receiver / Spectrum Analyser	ESI 40	Rohde & Schwarz	100064/040	480355	11.02.2020	02.2021

7 Test site Validation

Test equipment	PM. No.	Frequency range	Type of validation	According to	Val. Date	Val Due
Semi anechoic chamber M276	483227	30 – 1000 MHz	NSA	ANSI C63.4a-2017	19.09.2019	18.09.2021
