Addendum to the Test Report

FCC ID AB6NT1900FRM

AB6NT1900FRM

Summary

This Addendum to the test report is submitted following the FCC Correspondence Reference Number 22678 (731 Confirmation Number EA528649).

It contains following test results:

1. Frequency stability measurements
2. Spurious (Conductive) emissions at antenna terminals+

AB6NT1900FRM

1. Frequency stability measurements

Requirements

FCC Part 2.1055 Measurements required: Frequency stability

(a) The frequency stability shall be measured with variation of ambient temperature as follows:

1. From -30 deg. C to +50 deg. C for all equipment except that specified in paragraphs (a) (2) and (3) of this section.

...
(b) Frequency measurements shall be made at the extremes of the temperature range and at intervals of not more than 10 deg. centigrade through the range

...
(d) The frequency stability shall be measured with variation of primary supply voltage as follows:

1. Vary primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment.

...

1.1 Frequency stability over temperature range

Table 1. Frequency variation over temperature.

2. Spurious Emissions at Antenna Terminals

Requirements

FCC Part 2.1051

The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the output terminals when properly loaded with a suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission than can be detected when the equipment is operated under conditions specified in 2.1049 as appropriate

The magnitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be specified

2.1 Test summary

The summary of the test results is shown in Table 3

Table 3.
