5. Antenna Interface

SIM800C provides GSM antenna named GSM_ANT, customer could use 50Ω microstrip line or stripline antenna connect to the module.

The maximum gain of the Main antenna gain should not exceed 3dBi considering the SAR radio. No antenna gain may be used that would exceed the 2W EIRP power limit in 1900MHz band.

It have according to reference trace and matching circuit testing all FCC items, and all items satisfy FCC requirements. Only the reference trace and matching circuit is certified, antenna design must refer to it, any other deviations require testing Class II applications as required by FCC.

The certified matching circuit as following:

Figure4: GSM antenna matching circuit

R101, C101, C102 are the matching circuit, the value should be defined by the antenna design. Normally R101 is 0Ω, C101 and C102 are not mounted.

The RF connector is used for conduction test. If the space between RF pin and antenna is not enough, the matching circuit should be designed as in the following figure:

Figure5: GSM antenna matching circuit without RF connector

Normally R101 is 0 Ω , C101 and C102 are not mounted.
