I, the undersigned, hereby declare that the equipment tested and referenced in this report conforms to the identified standard(s) as described in this test report. No modifications were made to the equipment during testing in order to achieve compliance with these standards. Furthermore, there was no deviation from, additions to, or exclusions from, the applicable parts of FCC Part 2, FCC Part 15, ISED RSS-Gen and ANSI C63.10.

# 1 General Information

## 1.1 Scope

This is an original FCC and ISED Canada certification application report.

Applicable Standards:

- FCC Part 15.245: Operation within the bands 902–928 MHz, 2435–2465 MHz, 5785–5815 MHz, 10500–10550 MHz, and 24075–24175 MHz
- RSS-210 Issue 10 Low Power Licence-Exempt Radiocommunication Devices (All Frequency Bands) Category I Equipment

## 1.2 Description of EUT

Equipment Under Test	Flow Meter
Model	RSS-2-300WL
Power Supply	External 12 VDC
Modulation Type	CW
Frequency Range	24158.3 MHz
Antenna Connector Type	N/A
Antenna Type	Array Antenna

#### 1.3 Test Facility

The open area test site and conducted measurement facility used to collect the radiated data is located at 360 Herndon Parkway, Suite 1400, Herndon, Virginia 20170.

CAB ID: US0079

#### 1.4 Measurement Uncertainty

The measurement uncertainty complies with CISPR 16-4-2 limits and is not used to adjust measurements for compliance determination. Expanded uncertainty (U) for each scope, calculated per ANSI/NCSL Z540-2-1997 (R2002) with a type B evaluation, is provided in this RTL report. While this demonstrates RTL's commitment to transparency, compliance decisions are based solely on comparing measured values directly to the relevant standards' limits.

#### 1.5 Related Submittal(s)/Grant(s)

This is an original application for certification for the Geolux RSS-2-300WL Non-Contact Flow Meter, FCC ID: 2AN9X-RSS2300WL; IC: 26475-RSS2300WL.

#### 1.6 Modifications

No modifications were made to the equipment during testing in order to achieve compliance with these standards.

# 2 Test Information

## 2.1 Description of Test Modes

In accordance with FCC 15.31(m), one frequency was tested.

## 2.2 Exercising the EUT

The EUT was supplied with test firmware Geolux Water Discharge Sensor - RSS-2-300WL 6.9.0. RTL used the PuTTY terminal emulator to send commands to switch frequencies to the firmware. The EUT was tested in all three orthogonal planes in order to determine worst-case emissions.

## 2.3 Test Result Summary

## Table 2-1:Test Result Summary

Test	FCC Standard	ISED Standard	Pass/Fail or N/A
AC Power Conducted Emissions	FCC 15.207	RSS-Gen	Pass
Radiated Emissions	FCC 15.209	RSS-Gen	Pass
Field Strength of Fundamental and Harmonics	FCC 15.245(b)	RSS-210 F1	Pass
20 dB Bandwidth	FCC 15.215(c)	RSS-Gen	Pass

#### 2.4 Test System Details

The test sample was received on March 27, 2024. Listed below are the identifiers and descriptions of all equipment, cables, and internal devices used with the EUT for this testing, as applicable.

Table 2-2:	Equipment Under Test
------------	----------------------

Part	Manufacturer	Model (HVIN)	Serial Number	FCC ID	Cable Description	RTL Bar Code
Flow Meter	Geolux d.o.o.	RSS-2-300WL	RSS-0012- 0279	2AN9X- RSS2300WL	9.3 m shielded	24414
Flow Meter	Geolux d.o.o.	RSS-2-300WL	RSS-0012- 0280	2AN9X- RSS2300WL	9.3 m shielded	24413

#### Table 2-3: Ancillary Equipment

Part	Manufacturer	Model (HVIN)	Serial Number	FCC ID	Cable Description	RTL Bar Code

Client: Geolux d.o.o. Model/HVIN: RSS-2-300WL Standards: FCC 15.245/RSS-210 IDs: 2AN9X-RSS2300WL/26475-RSS2300WL Report #: 2023076FDS

# 2.5 Configuration of Tested System

Figure 2-1: Configuration of System Under Test

## 3 Radiated Emissions – FCC 15.209, 15.245(b); RSS-Gen, RSS-210

#### 3.1 Limits of Radiated Emissions Measurement

15.209 Limits					
Frequency (MHz)	Field Strength (uV/m)	Measurement Distance (m)			
0.009-0.490	2400/f (kHz)	300			
0.490-1.705	2400/f (kHz)	30			
1.705-30.0	30	30			
30-88	100	3			
88-216	150	3			
216-960	200	3			
Above 960	500	3			
10,500 – 10,550 (fundamental)	2,500,000	3			
harmonics	25,000	3			

As shown in 15.35(b), for frequencies above 1,000 MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any circumstances of modulation.

15.245 Limits									
Fundamental Frequency (MHz)	Field Strength of Fundamental (millivolts/meter)	Field Strength of Harmonics (millivolts/meter)							
902-928	500	1.6							
2435-2465	500	1.6							
5786-5815	500	1.6							
10500-10550	2500	25.0							
24075-24175	2500	25.0							

#### 3.2 Radiated Emissions Measurement Test Procedure

Before final measurements of radiated emissions were made on the open-field three/ten meter range, the EUT was scanned indoors at one and three meter distances. This was done in order to determine its emissions spectrum signature. The physical arrangement of the test system and associated cabling was varied in order to determine the effect on the EUT's emissions in amplitude, direction and frequency. This process was repeated during final radiated emissions measurements on the open-field range, at each frequency, in order to ensure that maximum emission amplitudes were attained.

Final radiated emissions measurements were made on the three/ten-meter open-field test site. The EUT was placed on a nonconductive turntable 0.8 meters above the ground plane. The spectrum was examined from 9 kHz to 100 GHz per FCC 15.33(2).

At each frequency, the EUT was rotated 360°, and the antenna was raised and lowered from 1 to 4 meters in order to determine the emission's maximum level. Measurements were taken using both horizontal and vertical antenna polarizations. For frequencies between 30 and 1000 MHz, the spectrum analyzer's 6 dB bandwidth was set to 120 kHz, and the analyzer was operated in the CISPR quasi-peak detection mode. For emissions above 1000 MHz, emissions are measured using the average detector function with a minimum resolution bandwidth of 1 MHz. No video filter less than 10 times the resolution bandwidth was used. The highest emission amplitudes relative to the appropriate limit were measured and recorded in this report.

# 4 AC Conducted Emissions - FCC 15.207; RSS-Gen

## 4.1 Test Methodology for Conducted Line Emissions Measurements

The power line conducted emission measurements were performed in a Series 81 type shielded enclosure manufactured by Rayproof. The EUT was assembled on a wooden table 80 centimeters high. Power was fed to the EUT through a 50-ohm / 50 microhenry Line Impedance Stabilization Network (EUT LISN). The EUT LISN was fed power through an A.C. filter box on the outside of the shielded enclosure. The filter box and EUT LISN housing are bonded to the ground plane of the shielded enclosure. A second LISN, the peripheral LISN, provides isolation for the EUT test peripherals. This peripheral LISN was also fed A.C. power. A metal power outlet box, which is bonded to the ground plane and electrically connected to the peripheral LISN, powers the EUT host peripherals.

The spectrum analyzer was connected to the A.C. line through an isolation transformer. The 50-ohm output of the EUT LISN was connected to the spectrum analyzer input through a Solar high-pass filter. The filter is used to prevent overload of the spectrum analyzer from noise below 100 kHz. Conducted emission levels were measured on each current-carrying line with the spectrum analyzer operating in the CISPR quasi-peak mode (or peak mode if applicable). The analyzer's 6 dB bandwidth was set to 9 kHz. No video filter less than 10 times the resolution bandwidth was used. Average measurements are performed in linear mode using a 10 kHz resolution bandwidth, a 1 Hz video bandwidth, and by increasing the sweep time in order to obtain a calibrated measurement. The emission spectrum was scanned from 150 kHz to 30 MHz. The highest emission amplitudes relative to the appropriate limit were measured and have been recorded in this report.

#### 4.2 Conducted Line Emission Test Procedure

The conducted test was performed with the EUT exercise program loaded, and the emissions were scanned between 150 kHz to 30 MHz on the NEUTRAL SIDE and PHASE SIDE.

# 5 20 dB Bandwidth – FCC 15.215(c); RSS-Gen

## 5.1 20 dB Bandwidth Test Procedure

The 20 dB bandwidths were measured using a 50-ohm spectrum analyzer. The modulated carrier was adjusted on the analyzer so that it was displayed entirely on the spectrum analyzer. The sweep time was auto and allowed through several sweeps with the max hold function used in peak detector mode. The resolution bandwidth was set to 200 Hz, and the video bandwidth set to 3 MHz. The table below contains the bandwidth measurement results.

RTL Asset #	Manufacturer	Model	Part Type	Serial Number	Calibration Due Date
901773	Rohde & Schwarz	FSW50	Analyzer	101021	05/30/2025
901640	Rohde & Schwarz	FS-Z110	Mixer (75 – 110 GHz)	100010	05/03/2025
900711	ATM	10-443-6R	Horn Antenna (75 - 110 GHz)	8051905-1	06/23/2025
901727	Insulated Wire Inc.	KPS-1503-360- KPR	SMK RF Cables 36"	NA	11/30/2025
901774	RF Depot	TMS-SFT-205	36" SMA Cable	N/A	07/06/2025

#### Conclusion 6

The data in this measurement report shows that the EUT as tested, Geolux d.o.o. Model RSS-2-300WL, FCC ID: 2AN9X-RSS2300WL; IC: 26475-RSS2300WL, complies with all the applicable requirements of Parts 2 and 15 of the FCC Rules and Regulations and ISED Canada RSS-210 and RSS-Gen.
