### 4.1. Test reference and limit

The measurement is made according to FCC rules parts 27 and ANSI C63.26, section 5.5, as follows:

Below 1GHz:

The Preliminary Measurement and the Final Measurement is performed in 3m distance by rotating the turntable of 360 degrees.

The Preliminary Measurement is performed with floor absorbers on the floor and measuring antenna at fixed height using 2-axis EUT position system.

The Final Measurement is performed if the Preliminary Measurement results are closer than 20 dB to the permissible limit.

The Final Measurement is performed without floor absorbers and antenna height between 1m and 4m.

Between 1-18GHz:

The Preliminary Measurement and the Final Measurement is performed in 3m distance by rotating the turntable of 360 degrees at fixed height.

The Preliminary Measurement and the Final Measurement is performed with absorbers on the floor and measuring antenna at fixed height using 2-axis EUT position system.

The Final Measurement is performed, if the Preliminary Measurement results are closer than 20 dB to the permissible limit.

Above 18GHz:

The Preliminary Measurement and the Final Measurement is performed in 1.5m distance by rotating the turntable of 360 degrees at fixed height.

The Preliminary Measurement and the Final Measurement is performed with absorbers on the floor and measuring antenna at fixed height using 2-axis EUT position system.

The Final Measurement is performed, if the Preliminary Measurement results are closer than 20 dB to the permissible limit.

General:

The emissions less than 20 dB below the permissible value are reported. The measurement results are obtained by using the direct field strength method and pre-test site path loss characterization.

$$\text{ERP (dBm)} = U_{\text{RX}} (\text{dB}\mu\text{V}) - 107 + A_{\text{CF}} (\text{dB}) + G_{\text{CF}} (\text{dB})$$

$$\text{EIRP (dBm)} = \text{ERP (dBm)} + 2.15$$

$U_{RX}$  = is the receiver reading

$A_{CF}$  = is the signal path correction factor including cable loss and preamplifier gain

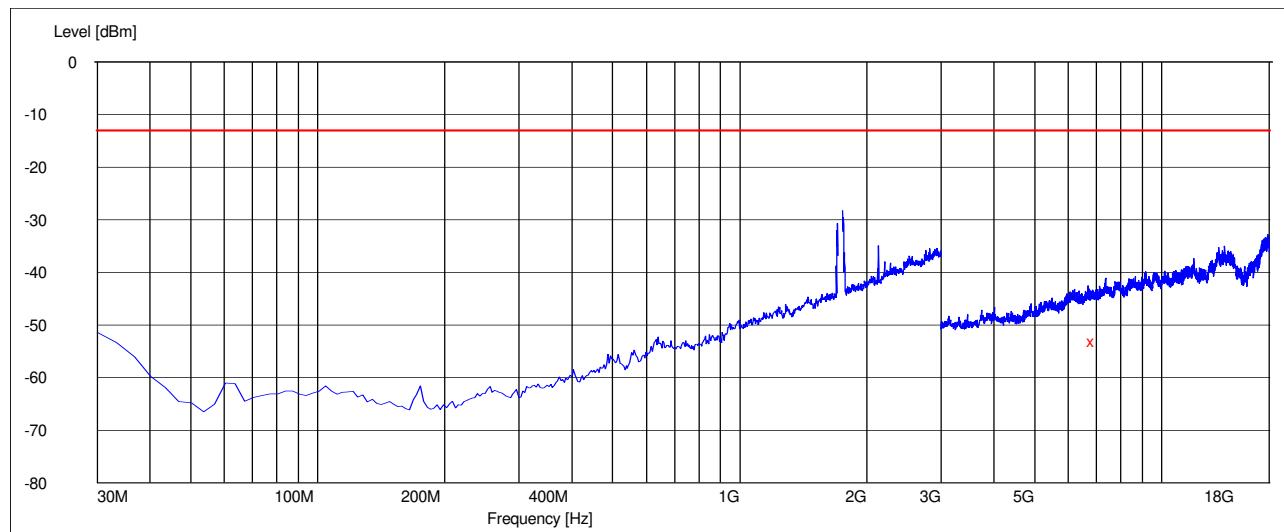

$G_{CF}$  = is the pre-test site path loss characterization factor including site path loss and antenna gain.
