S.A.R. EME Compliance Test Report
Part 1 of 3

Date of Report:	November 20, 2003
Report Revision:	Rev. O
Manufacturer:	Motorola
Product Description:	Portable 136-174 MHz, 5W, 32 CH w/ display/Limited Keypad
FCC ID:	**ABZ99FT3050**
Device Model:	PMUD1928A

Test Period:	11/6/03 – 11/13/03
EME Technician:	Ed Church
Responsible Engineer:	Kim Uong (Sr. EME Engineer)
Author:	Michael Sailsman Global EME Regulatory Affairs Liaison

Note: Based on the information and the testing results provided herein, the undersigned certifies that when used as stated in the operating instructions supplied, said product complies with all applicable national and international reference standards and guidelines.

Deanna Zakharia Signature on File — 11/20/03

1.0 Introduction

This report details the utilization, test setup, test equipment, and updated test results of the Specific Absorption Rate (S.A.R.) measurements performed at the CGISS EME Test Lab for model number PMUD1928A, FCC ID: ABZ99FT3050.

The applicable exposure environment is Occupational/Controlled.

2.0 Reference Standards and Guidelines

This product is designed to comply with the following national and international standards and guidelines.

- United States Federal Communications Commission, Code of Federal Regulations; 47CFR part 2 sub-part J
- IEEE 1528, 2003 "Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques,"
- American National Standards Institute (ANSI) / Institute of Electrical and Electronic Engineers (IEEE) C95. 1-1992
- Institute of Electrical and Electronic Engineers (IEEE) C95.1-1999 Edition
- International Commission on Non-Ionizing Radiation Protection (ICNIRP) 1998
- Ministry of Health (Canada) Safety Code 6. Limits of Human Exposure to Terminal frequency Electromagnetic Fields in the Frequency Range from 3 kHz to 300 GHz, 1999
- Australian Communications Authority Radiocommunications (Electromagnetic Radiation - Human Exposure) Standard 2003
- ANATEL, Brazil Regulatory Authority, Resolution 256 (April 11, 2001) "additional requirements for SMR, cellular and PCS product certification."

3.0 Description of Test Sample

The portable handheld transceiver, FCC ID: ABZ99FT3050, operates using Frequency Modulation (FM) incorporating traditional simplex two-way radio transmission protocol. The intended operating positions are “at the face” with the DUT 1 to 2 inches from the mouth, and “at the body” by means of the offered body-worn accessories. Audio and PTT operation while the radio is at the body is accomplished by means of optional remote accessories that connect to the radio. This device will be marketed to and used by employees solely for work-related operations, such as public safety agencies, e.g. police, fire and emergency medical. User training is the responsibility of these agencies, which can be expected to employ the usage instructions, safety information and operational cautions set forth in the user's manual, instructional sessions or other means. Motorola also makes available to its customers training classes on the proper use of two-way radios and wireless data devices.

FCC ID: ABZ99FT3050 is capable of operating in the 136-174 MHz band. The rated power is 5 watts with a maximum output capability of 5.7 watts as defined by the upper limit of the production line final test station.

FCC ID: ABZ99FT3050 is offered with the following options and accessories:

Antenna

PMAD4027A	Helical 136-155 MHz antenna; -10dBd
PMAD4028A	Helical 148-174 MHz antenna; -10dBd
PMAD4012A	Helical 136-155 MHz antenna; -12dBd
PMAD4013A	Helical 155-174 MHz antenna; -12dBd
PMAD4014A	Helical 136-155 MHz antenna; -10dBd
PMAD4015A	Helical 155-174 MHz antenna; -10dBd
NAD6502AR	Heliflex 146-174 MHz antenna; -4dBd

Batteries

PMNN4046A	Std. NiMH battery

Body-worn Accessories

4285820Z01	Shoulder Strap
HLN9844A	Belt Clip (1.5” belt width)
PMLN4467A	Carry case, Soft Leather Black
PMLN4468A	Carry Holster Case, Neoprene Grey
PMLN4469A	Carry Holster Case, Neoprene Blue
RLN4815A	Fanny Pack Carry Accessory
HLN9985B	Waterproof Bag

Audio attachments

PMLN4294C	Ear Set Mic w/PTT
PMLN4425A	Ear set Boom Mic w/ remote ring PTT
HMN9030A	Remote Speaker Mic
HMN9013A	Lightweight handset w/ Boom Mic

3.1 Test Signal

Test Signal mode:

Test Mode	X	Base Station		Simulator	

Transmission Mode:

CW	**X**

TDM:	
Other	

3.2 Test Output Power

Output power was measured before each test. The DASY 3 system's S.A.R. drift function was used to determine the power slump characteristic of the device. A characteristic power slump table based on 50 ohms measurements is provided in APPENDIX A for the battery producing the highest S.A.R. results.

4.0 Description of Test Equipment

4.1 Descriptions of S.A.R. Measurement System

The laboratory utilizes a Dosimetric Assessment System (DASY3™) S.A.R. measurement system manufactured by Schmid & Partner Engineering AG (SPEAG™), of Zurich Switzerland. The test system consists of a Stäubli RX90L robot with an ET3DV6 E-Field probe. Please reference the SPEAG user manual and application notes for detailed probe, robot, and S.A.R. computational procedures.
The S.A.R. measurements were conducted with probe model/serial number ET3DV6/SN1383. The system performance check was conducted daily and within 24 hours prior to testing. DASY output files of the system performance test results and the probe/dipole calibration certificates are included in appendices C and D respectively. The table below summarizes the system performance check results normalized to 1W.

Probe Serial #	Tissue Type	Probe Cal Date	Dipole Kit / Serial #	System Perf. Result when normalized to 1W (mW/g)	Reference S.A.R @ 1W (mW/g)	Test Date(s)
1383	FCC Body	2/26/03	SPEAG D300V2 /1002	2.755 +/- 0.045	2.74 +/- 10%	11/6/03-11/13/03 6 test days
1383	IEEE Head	2/26/03	SPEAG D300V2 /1002	2.890 +/- 0.050	2.99 +/- 10%	11/11/03-11/12/03

Note: see APPENDIX C for an explanation of the reference S.A.R. targets stated above.

The DASY3™ system is operated per the instructions in the DASY3™ Users Manual. The complete manual is available directly from SPEAG™. All measurement equipment used to assess EME S.A.R. compliance was calibrated according to 17025 A2LA guidelines.

4.2 Description of Phantom

4.2.1 Flat Phantom

A rectangular shaped box made of high-density polyethylene (HDPE) with a dielectric constant of 2.26 and a loss tangent of less than 0.00031 was used to assess performance at the body and face. The phantom mounts on a wooden supporting structure having a loss tangent of < 0.05. The support structure has a 68.58 cm x 25.4 cm opening at its center to allow positioning the DUT to the phantom's surface. The table below shows the flat phantom dimensions used for S.A.R. performance assessment at the body and face.

	Body/Face
Length	80cm
Width	60cm
Height	20cm
Surface Thickness	0.2cm

4.2.2 SAM Phantom

SAM Phantom assessment was not applicable for this filing.

4.3 Simulated Tissue Properties

4.3.1 Type of Simulated Tissue

The simulated tissue used is compliant to that specified in FCC Supplement C (Edition 01 - 01) to OET Bulletin 65 (Edition 97 - 01).

Simulated Tissue	**Body Position**
FCC Body	Torso
IEEE Head	Face

4.3.2 Simulated Tissue Composition

Tissue Ingredient (%) @ 300 MHz		
	Head	**Body**
Sugar	56	47.1
DGBE (Glycol)	-	-
De ionized -Water	37.5	49.48
Salt	5.4	2.32
HEC	1.0	1.0
Bact.	0.1	0.1

Characterization of Simulated tissue materials and ambient conditions:

Simulated tissue prepared for S.A.R. measurements is measured daily and within 24 hours prior to actual S.A.R. testing to verify that the tissue is within 5% of target parameters at the center of the transmit band. This measurement is done using the Agilent (HP) probe kit model 85070C and a HP8753D Network Analyzer.

Tissue parameters

FCC Body				
Frequency (MHz)	**Di-electric Constant Target**	**Di-electric Constant Meas. (Range)**	**Conductivity Target S/m**	**Conductivity Meas. (Range) S/m**
155	61.8	59.2-59.9	0.80	0.77-0.78
300	58.2	55.8-56.4	0.92	0.88-0.88

IEEE Head				
Frequency (MHz)	**Di-electric Constant Target**	**Di-electric Constant Meas. (Range)**	**Conductivity Target S/m**	**Conductivity Meas. (Range) S/m**
155	52.1	52.6-53.1	0.76	0.73-0.76
300	45.3	46.7-47.5	0.87	0.84-0.88

4.4 Test conditions

The EME Laboratory ambient environment is well controlled resulting in very stable simulated tissue temperature and therefore stable dielectric properties. Simulated tissue temperature is measured prior to each scan to insure it is within +/ - 2°C of the temperature at which the dielectric properties were determined. The liquid depth within the phantom used for measurements was 15cm +/- 0.5cm. Additional precautions are routinely taken to ensure the stability of the simulated tissue such as covering the phantoms when scans are not actively in process in order to minimize evaporation. The lab environment is continuously monitored. The table below presents the range and average environmental conditions during the S.A.R. tests reported herein:

	Target	**Measured**
Ambient Temperature	20 - 25 ˚C	Range: 21.4-23.3˚C Avg. 22.3˚C
Relative Humidity	30 - 70 %	Range: 43.4-59.1% Avg. 45.9%
Tissue Temperature	NA	Range: 20.3-21.3˚C Avg. 22.73˚C

The EME Lab RF environment uses a Spectrum Analyzer to monitor for extraneous large signal RF contaminants that could possibly affect the test results. If such unwanted signals are discovered the S.A.R scans are repeated. However, the lab environment is sufficiently protected such that no S.A.R. impacting interference has been experienced to date.

5.0 Description of Test Procedure

All options and accessories listed in section 3.0 were considered in order to develop the S.A.R. test plan for this product. S.A.R. measurements were performed using a flat phantom to assess performance at the body and face. All assessments were done using the flat phantom with the DUT in CW mode. Applicable tissue parameters were used for each body location assessment.

DUT assessment at the body; Antenna search

The DUT was assessed against the flat phantom, near the center frequency of each antenna's TX band, with the offered belt clip, using the offered battery, and the Remote Speaker Microphone.

DUT assessment at the body; Other carry case accessories search

The DUT was assessed against the flat phantom, using the configuration above that produced the highest S.A.R. results, along with each of the offered carry case accessories.

DUT assessment at the body; Other audio accessories search

The DUT was assessed using the worst-case configuration from the assessments above with each of the offered audio accessories not previously tested.

DUT assessment at the body; Across the TX band for each offered antenna

The DUT was assessed across each of the offered antenna's TX band, using the worst-case test configuration from the audio assessment above.

DUT assessment at the body; 2.5cm separation

The DUT was assessed with 2.5cm separation from the phantom, using the worst-case test configuration from the antenna assessment above without the associated carry case accessory.

DUT assessment at the body; "Shortened" scan of worst-case test configuration

The DUT was assessed using the worst-case test configuration at the body overall utilizing a shortened cube scan.

DUT assessment at the Face; Across the frequency band of each offered antenna

The DUT was assessed with 2.5cm separation distance from the phantom, across the TX band of each offered antenna.

DUT assessment at the Face; "Shortened" scan of worst-case test configuration

The DUT was assessed using the worst-case test configuration at the face overall utilizing a shortened cube scan.

5.1 Device Test Positions

Reference figure 1 for the device orientation and position which exhibited the highest S.A.R. performance.

5.1.1 Body

The DUT was positioned such that the applicable carry case accessories were centered against the flat phantom. The DUT back housing, front housing was positioned with 2.5cm separation distance from the flat phantom.

5.1.2 Head

Assessments at the head was not applicable for this filing

5.1.3 Face

The DUT was positioned at the center of the flat phantom with a 2.5cm separation distance from the front housing.

5.2 Test Position Photographs

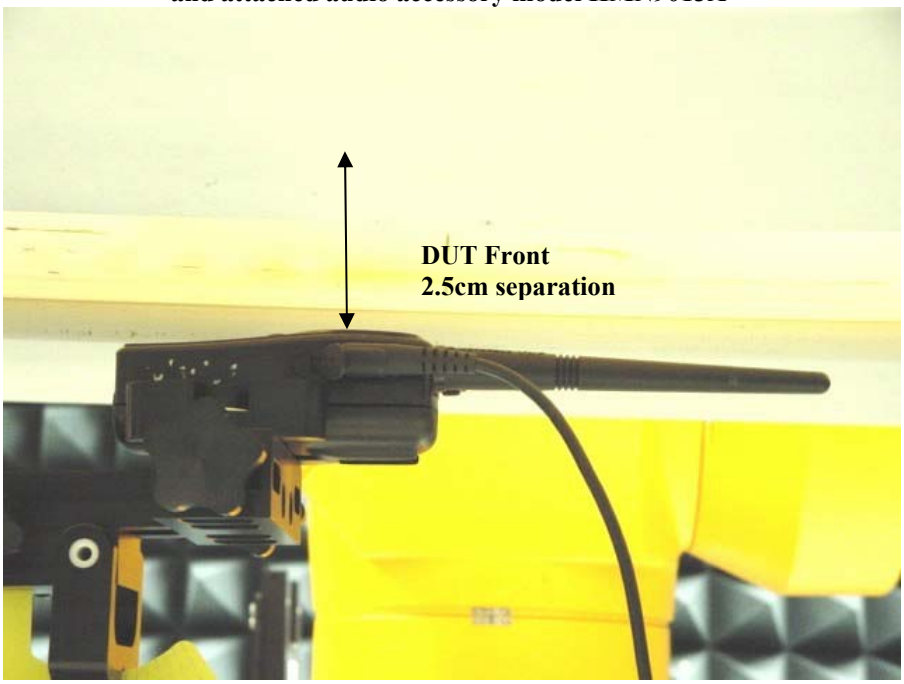

Figure 6: Assessment @ the Body;
DUT back towards the phantom and separated 2.5cm, with antenna model PMAD4015A,
and attached audio accessory model HMN9013A

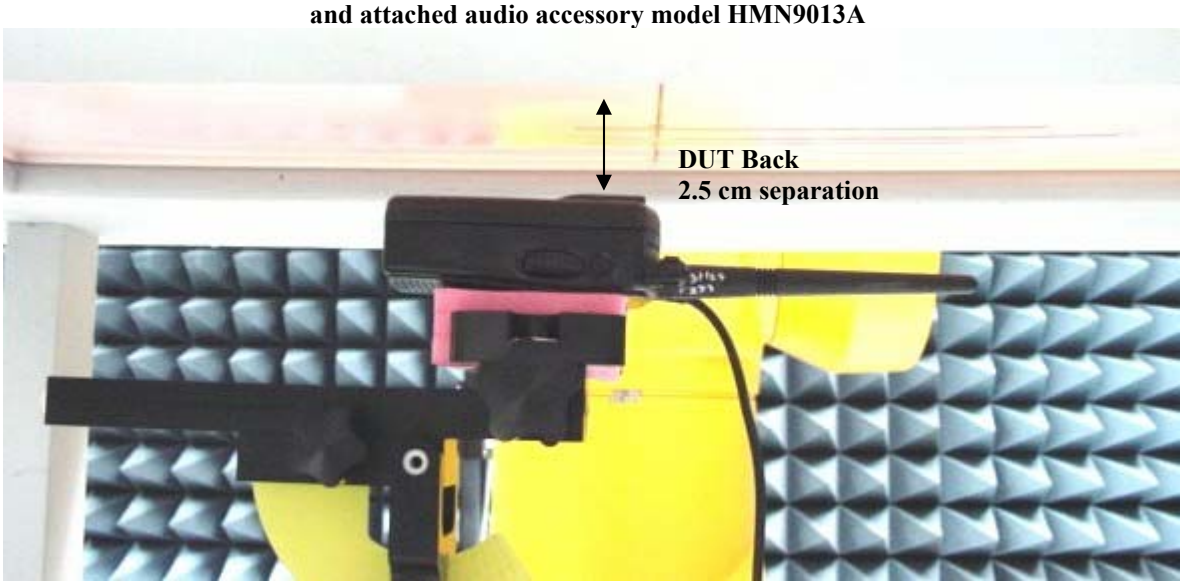

Figure 7: Assessment @ the Face;
DUT Front towards the phantom and separated 2.5cm, with antenna model PMAD4015A

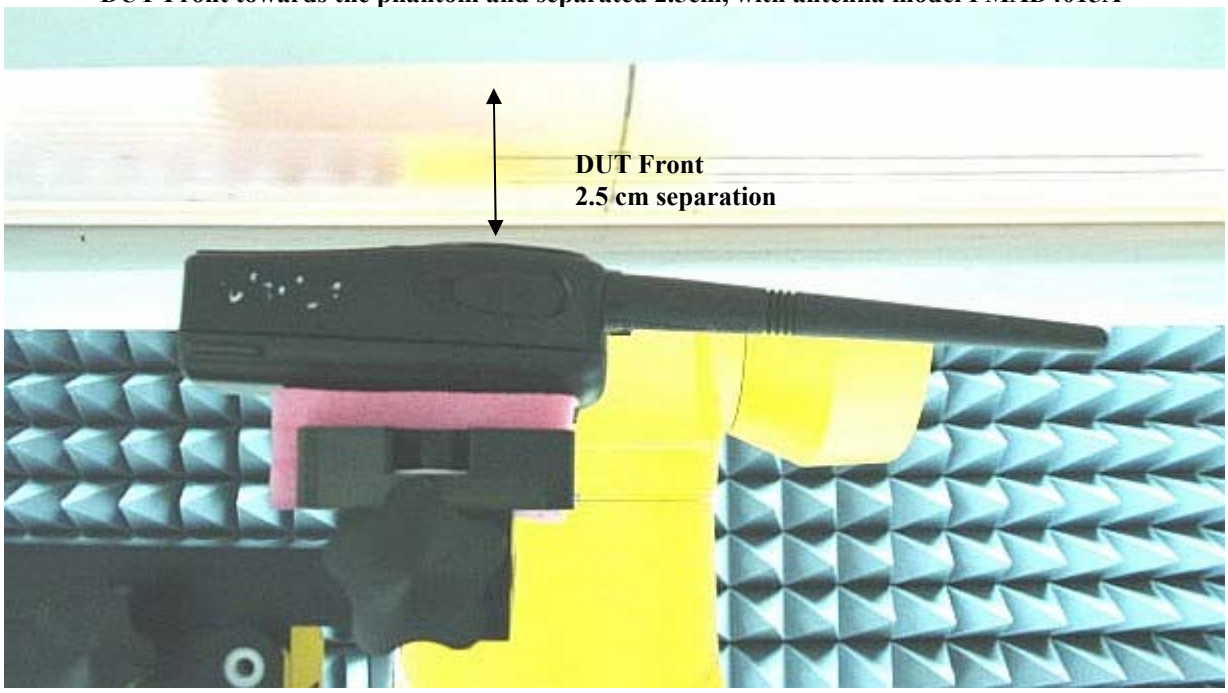

Figure 8: Robot Test Setup (Body & Face)

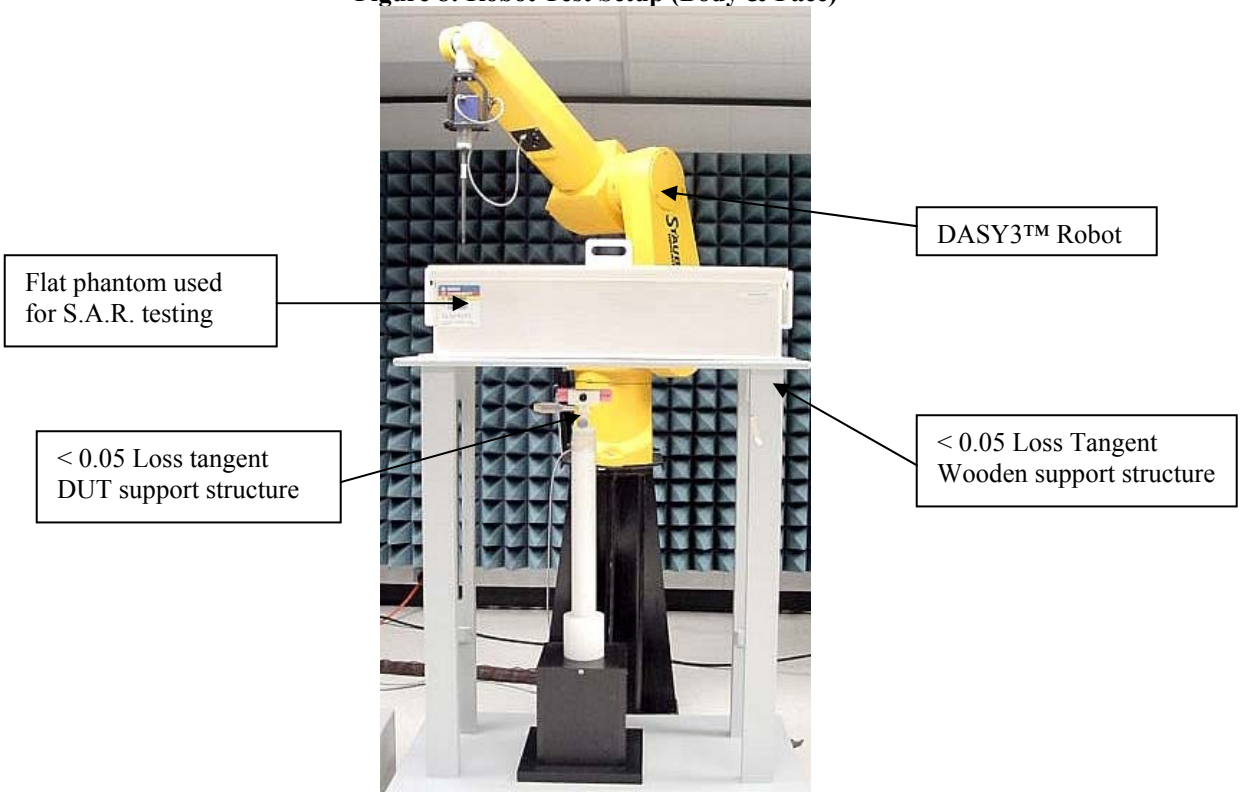

5.3 Probe Scan Procedures

The E-field probe first scans a coarse grid over a large area inside the phantom in order to locate the interpolated maximum S.A.R. distribution. After the coarse scan measurement, the probe is automatically moved to a position at the interpolated maximum. The subsequent scan can directly use this position as reference for the cube evaluations.

Notes for Tables 1 and 2
a) Column headings *a-k* are given for reference.
b) Tol. - tolerance in influence quantity.
c) Prob. Dist. – Probability distribution
d) N, R - normal, rectangular probability distributions
e) Div. - divisor used to translate tolerance into normally distributed standard uncertainty
f) *ci* - sensitivity coefficient that should be applied to convert the variability of the uncertainty component into a variability of SAR.
g) *ui* – SAR uncertainty
h) *vi* - degrees of freedom for standard uncertainty and effective degrees of freedom for the expanded uncertainty.

7.0 S.A.R. Test Results

All S.A.R. results obtained by the tests described in Section 5.0 are listed in section 7.1 below. DASY3™ S.A.R. measurement scans are provided in APPENDIX B for the bolded S.A.R. results presented in section 7.1.

7.2 Peak S.A.R. location

Refer to APPENDIX B for detailed S.A.R. scan distributions.

7.3 Highest S.A.R. results calculation methodology

The calculated maximum 1-gram and 10-gram averaged S.A.R. value is determined by scaling the measured S.A.R. to account for power leveling variations and power output slump below the reported maximum power during the S.A.R. measurements. For this device the Maximum Calculated 1-gram and 10-gram averaged peak S.A.R. is calculated using the following formula:

Max. Calc. 1-g and 10-g Avg. SAR = ((S.A.R. meas. / (10^(Pdrift/10))*(Pmax/Pint))* DC%)
P_{max} = Maximum Power (W)
P_{int} = Initial Power (W)
Pdrift = DASY drift results (dB)
$SAR_{meas.}$ = Measured 1 gram averaged peak S.A.R. (mW/g)
DC % = Transmission mode duty cycle in % where applicable
Note that the use of the above formula should consider the relationship between the initial power, max power, and drift in determining conservative results.

8.0 Conclusion

The highest Operational Maximum Calculated 1-gram and 10-gram average S.A.R. values found for FCC ID: ABZ99FT3050

At the Body: 1-g Avg. = 6.26 mW/g; 10-g Avg. = 3.25 mW/g
At the Face: 1-g Avg. = 2.28 mW/g; 10-g Avg. = 1.72 mW/g
At the Head: NA

These test results clearly demonstrate compliance with FCC Occupational/Controlled RF Exposure limits of **8.0 mW/g** per the requirements of 47 CFR 2.1093(d)
