1 Report Summary

1.1 Report Modification Record

Alterations and additions to this report will be issued to the holders of each copy in the form of a complete document.

Table 1.1-1 – Modification Record

Issue	Description of Change	Date of Issue
1	First Issue	04 December 2024
2	- Corrected frequency typo in Section 1.5.2 - Updated verbiage in all test section's Environmental Conditions description - Added a statement in the Test Results section of Occupied Bandwidth to better reflect that the signal characteristics are taken using a Viper signal generator and that the data dose not limit the use of devices with 5kHz and 25kHz channels - Testing was redone for Frequency Stability and this section was updated with those results.	06 December 2024
3	- Updated data in Section 2.5 - Updated standard references in Section 1.2	15 January 2025
4	- Add statement to Section 2.5.4 mentioning that a GPS signal was not present during testing.	22 January 2025
5	- Updated data in section 2.1 RF output power with data from the TUV SUD San Diego lab - Updated data in section 2.3 conducted spurious emissions - Add TUV SUD San Diego lab's address to section 1.8 Test Locations	12 February 2025
6	- Updated data in section 2.1 RF output power with data from the TUV SUD San Diego lab	13 February 2025
7	- Update Technical description in section 1.5.1 and data in section 2.1 RD output Power	14 February 2025

1.2 Introduction

Applicant	Cobham Satcom
Applicant's Email Address	reetika.bishnoi@cobhamsatcom.com
Model Number(s)	Yahsat T-TAC ManPack
Part Number(s)	408063A-41000
Number of Samples Tested	1
Test Specification/Issue/Date	FCC 47 CFR Part 15.25
Order Number	721001137
Date of Receipt of EUT	07 October 2024

Start of Test	07 October 2024
Finish of Test	14 February 2025
Related Document(s)	ANSI C63.26 2015

TÜV SÜD America Inc
141 14th Street NW
New Brighton, MN 55112

1.3 Scope of Testing

To perform certification testing to confirm that the wireless device(s) meet the requirements of the applicable standards and guidance documents.

1.4 Summary of Results

A summary of the tests carried out in accordance with the specifications shown below.

Table 1.4-1 – Summary of Results

Section	Specification Clause	Test Description	Accreditation	Base Standard
2.1	25.204(a) / 2.1046	RF Output Power	A2LA	ANSI C63.26:2015
2.2	25.1049	Occupied Bandwidth	A2LA	ANSI C63.26:2015
2.3	25.202(f) / 2.1051	Conducted Spurious Emissions	A2LA	ANSI C63.26:2015
2.4	25.202(f) / 2.1053	Radiated Spurious Emissions	A2LA	ANSI C63.26:2015
2.5	25.202(d) / 2.1055	Frequency Stability	A2LA	ANSI C63.26:2015
2.6	25.216(c)(h)(i)	Protection of Aeronautical Radio Navigation Satellite Service	A2LA	ANSI C63.26:2015

Table 1.4-2 – Test Accreditation

Test Name	Name of Tester(s)	Results / Comments
RF Output Power	Miguel Rabago	Pass
Occupied Bandwidth	Sean Sellergren	Pass
Conducted Spurious Emissions	Miguel Rabago	Pass
Radiated Spurious Emissions	Sean Sellergren	Pass
Frequency Stability	Sean Sellergren	Pass
Protection of Aeronautical Radio Navigation Satellite Service	Sean Sellergren	Pass

1.5 Product Information

1.5.1 Technical Description

Table 1.5-1 – Wireless Module Technical Information

Detail	Description
FCC ID	ROJ-8063A
Transceiver Model #	408063A-41000
Operating Frequency	1626.5 MHz – 1660.5 MHz
Modulation Format	N/A
Antenna Type / Gain:	1dBi

Note: The EUT receives a signal from another source in the 400MHz range and upconverts the signal to the appropriate 1626.5 – 1660.5MHz signal, the modulation and other signal characteristics are all derived from the source transmitter that is not part of the EUT system.

A full description and detailed product specification details are available from the manufacturer.

1.5.2 Modes of Operation

The tested mode of operation was:

Low Channel / Mode	1626.5 MHz
Mid Channel / Mode	1643.5 MHz
High Channel / Mode	1660.5 MHz

Note: all transmitted frequencies were derived using an external transmitter source connected via RF cable to the EUT. The following frequencies were used by the source transmitter: low ch 448MHz, mid ch 440MHz and high ch 453MHz.

1.6 Deviations from the Standard

No deviations from the applicable test standard were made during testing.

1.7 EUT Modification Record

The table below details modifications made to the EUT during the test program. The modifications incorporated during each test are recorded on the appropriate test pages.

Table 1.7-1 – Modification Record

Modification State	Description of Modification still fitted to EUT	Modification Fitted By	Date Modification Fitted
0	Initial State		

1.8 Test Location

For tests in sections 2.2 & 2.4 - 2.6:

TÜV SÜD conducted the following tests at our New Brighton, MN Test Laboratory.

Office address:

TÜV SÜD America
141 14th Street NW
New Brighton, MN 55112 USA

For tests in sections 2.1 & 2.3:

TÜV SÜD America Inc. (Mira Mesa)
10040 Mesa Rim Road
San Diego, CA 92121-2912
Phone: (858) 678 1400 Fax: (858) 546 0364.

2 Test Details

2.1 RF Output Power

2.1.1 Specification Reference

FCC 47 CFR Part 25.204(a) / 2.1046

2.1.2 Equipment Under Test and Modification State

As shown in §1.4 with modification state “0”, as noted in §1.6.

2.1.3 Date of Test

14 February 2025

2.1.4 Test Method

In bands shared coequally with terrestrial radio communication services, the equivalent isotropically radiated power transmitted in any direction towards the horizon by an earth station, other than an ESV, operating in frequency bands between 1 and 15 GHz, shall not exceed the following limits except as provided for in paragraph (c) of this section:

- + 40 dBW in any 4 kHz band for θ ≤0°
- + 40 + 3θ dBW in any 4 kHz band for 0° <θ ≤5°

where θ is the angle of elevation of the horizon viewed from the center of radiation of the antenna of the earth station and measured in degrees as positive above the horizontal plane and negative below it.

2.1.5 Environmental Conditions

All tests are performed within the ambient climatic conditions of the laboratory.

TÜV SÜD America Inc
141 14th Street NW
New Brighton, MN 55112

Phone: 651-631-2487
www.tuv-sud-america.com

2.1.6 Test Results

Table 2.1-1 – Peak Conducted Output Power Results

Frequency (MHz)	Measured Output Power EIRP (dBm)	Antenna Gain dBi	Output Power Limit (dBm)	Result
1626.5	35.28	0.6	70	Pass
1643.5	35.30	0.6	70	Pass
1660.5	34.90	0.6	70	Pass

Test Note: Measured output power includes the antenna gain of 1.8dBi, more stringent limit of +40dbW converted to dBm was used (70 dBm) instead of + 40 + 3θ dBW

Test Summary: An RF attenuator was used between the EUT output and the measurement receiver during testing. All measurement correction factors were entered into the receiver as an offset to provide corrected measurement results. EUT operated as intended before, during, and after testing.

Test Result: Pass

See data below for detailed results.

2.2 Occupied Bandwidth

2.2.1 Specification Reference

FCC 47 CFR Part 2.1049

2.2.2 Equipment Under Test and Modification State

As shown in §1.4 with modification state “0”, as noted in §1.6.

2.2.3 Date of Test

08 October 2024

2.2.4 Test Method

The occupied bandwidth measurement function of the spectrum analyzer was used to measure the 99% bandwidth value. The span of the analyzer was set to capture all products of the modulation process, including the emission sidebands. The RBW to 1-5% of the occupied bandwidth and the VBW set to ≥ 3 times the RBW.

2.2.5 Environmental Conditions

All tests are performed within the ambient climatic conditions of the laboratory.

TÜV SÜD America Inc
141 14th Street NW
New Brighton, MN 55112

Phone: 651-631-2487
www.tuv-sud-america.com

2.2.6 Test Results

Table 2.2-1 – Occupied Bandwidth Results

Frequency (MHz)	Occupied Bandwidth (kHz)
1626.5	17.887
1643.5	17.783
1660.5	17.799

Test Summary: The EUT does not supply its own transmit signal but performs upconversion and downconversion on a signal from an outside source. For testing the signal used was a Viper generator that was provided for the purposes of testing. The occupied bandwidth is not limiting the operation of devices with the use of 5kHz 25kHz channels. and The EUT operated as intended before, during, and after testing.

Test Result: Pass

See data below for detailed results.

2.3 Conducted Spurious Emissions

2.3.1 Specification Reference

FCC 47 CFR Part 25.202(f) / 2.1051

2.3.2 Equipment Under Test and Modification State

As shown in §1.4 with modification state “0”, as noted in §1.6.

2.3.3 Date of Test

12 February 2025

2.3.4 Test Method

The maximum peak conducted output power was measured in accordance with the ANSI C63.26. The RF output of the EUT was directly connected to the input of the spectrum analyzer along with a suitable external attenuator. The RBW of the spectrum analyzer was set to 4kHz and the VBW was set to ≥ 3 times the RBW. The spectrum analyzer span was set to cover the entire frequency range of 9kHz to 20GHz and the trace was set to max hold using the average detector to provide the mean output power.

The limit used for the entire frequency range is -13dBm which is equal to 43 dB plus 10*log(transmit power in W).

2.3.5 Environmental Conditions

All tests are performed within the ambient climatic conditions of the laboratory.

2.3.6 Test Results

Test Summary: An RF attenuator was used between the EUT output and the measurement receiver during testing. All measurement correction factors were entered into the receiver as an offset to provide corrected measurement results. EUT operated as intended before, during, and after testing.

.

Test Result: Pass

Cal Code Y = Passive Device, or Calibration not required when used with other calibrated equipment.

2.4 Radiated Spurious Emissions

2.4.1 Specification Reference

FCC 47 CFR Part 25.205(f) / 2.1053

2.4.2 Equipment Under Test and Modification State

As shown in §1.4 with modification state “0”, as noted in §1.6.

2.4.3 Date of Test

22 – 25 October 2024

2.4.4 Test Method

The EUT was set up in a semi-anechoic chamber on a remotely controlled turntable and placed on a non-conductive table 0.8 m above a reference ground plane for 30-1000 MHz and 1.5m above the ground plane for above 1 GHz.

For 30-1000 MHz a pre-scan of the EUT emissions profile was made while varying the antenna-to-EUT azimuth and antenna-to-EUT polarization using an average detector; measurements were taken at a 3m distance.

For above 1 GHz a pre-scan of the EUT emissions profile was made while varying the antenna-to-EUT azimuth and antenna-to-EUT polarization using average detectors; measurements were taken at a 3m distance.

For all frequency ranges the final readings were maximized by adjusting the antenna height, polarization and turntable azimuth, in accordance with the specification. Final measurements were re-measured with an average detector.

The EUT was assessed against the limits specified in FCC 47 CFR Part 25.205(f).

2.4.5 Environmental Conditions

All tests are performed within the ambient climatic conditions of the laboratory.

2.4.6 Additional Observations

The highest frequency to which the DUT was measured in accordance with §15.33(a)(1).

Automated measurements used BAT-EMC (v3.18) software. Measurements were done at a 3m distance. Reported level is the actual level with all the correction factors factored in. Correction Factor column is for informational purposes only.

2.4.7 Sample Computation (Radiated Emissions)

Measuring equipment raw measurement (dBµV) @ 30 MHz			20.0
Correction Factor (dB)	Cable 2	0.24	18.94
	TEMC00011 (antenna)	18.70	
Reported Quasi-peak Final Measurement (dBµV/m) @ 30 MHz			38.94

2.4.8 Test Results

Test Summary: An RF attenuator was used at the input to the RF pre-amp during testing. EUT operated as intended before, during, and after testing.

Test Result: Pass

See data below for detailed results.

2.5 Frequency Stability

2.5.1 Specification Reference

FCC Part 2.1055

2.5.2 Equipment Under Test and Modification State

As shown in §1.4 with modification state “0”, as noted in §1.6.

2.5.3 Date of Test

17 – 18 October 2024

2.5.4 Test Method

The equipment under test is placed inside an environmental chamber. The RF output is directly coupled to the input of the measurement equipment and a power supply is attached to the primary supply voltage.

Frequency measurements were made at the extremes of the of temperature range -20º C to +50º C and at intervals of 10º C at normal supply voltage. Sufficient time to stabilize all components of the equipment was allowed at each frequency measurement. The maximum variation of frequency was recorded.

The data collected during testing was collected without a GPS signal present.

2.5.5 Environmental Conditions

Ambient Temperature	22.3°C

TÜV SÜD America Inc

2.6 Protection of Aeronautical Radio Navigation Satellite Service

2.6.1 Specification Reference

FCC 47 CFR Part 25.216(c)(h)(i)

2.6.2 Equipment Under Test and Modification State

As shown in §1.4 with modification state “0”, as noted in §1.6.

2.6.3 Date of Test

15 October 2024

2.6.4 Test Method

The maximum peak conducted output power was measured in accordance with the ANSI C63.26. The RF output of the EUT was directly connected to the input of the spectrum analyzer along with a suitable external attenuator. The RBW of the spectrum analyzer was set to 1MHz and the VBW was set to ≥ 3 times the RBW. The spectrum analyzer span was set to cover the entire frequency range per the applicable section of the standard and the trace was set to max hold using the average detector to provide the mean output power.

The limit used for the entire frequency range is in dBW/MHz and was converted to dBm on the receiver using the formula: dBm = dBW + 30

2.6.5 Environmental Conditions

All tests are performed within the ambient climatic conditions of the laboratory.

2.6.6 Test Results

Test Summary: An RF attenuator was used between the EUT output and the measurement receiver during testing. All measurement correction factors were entered into the receiver as an offset to provide corrected measurement results. EUT operated as intended before, during, and after testing.

.

Test Result: Pass

See data below for detailed results.

4 Accreditation, Disclaimers and Copyright

TÜV SÜD America Inc.'s reports apply only to the specific sample tested under stated test conditions. It is the manufacturer's responsibility to assure the continued compliance of production units of this model. TÜV SÜD America, Inc. shall have no liability for any deductions, inferences or generalizations drawn by the client or others from TÜV SÜD America, Inc.'s issued reports.

This report is the confidential property of the client. As a mutual protection to our clients, the public and TÜV SÜD America, Inc., extracts from the test report shall not be reproduced, except in full without TÜV SÜD America, Inc.'s written approval.

This report must not be used to claim product certification, approval, or endorsement by A2LA, NIST, or any agency of the federal government.

STATEMENT OF MEASUREMENT UNCERTAINTY – Emissions

The test system for conducted emissions is defined as the LISN, tuned receiver or spectrum analyzer, and coaxial cable. This test system has a measurement uncertainty of ±3.30 dB. The test system for radiated emissions is defined as the antenna, the pre-amplifier, the spectrum analyzer and the coaxial cable. This test system for 30 MHz-1000 MHz has a measurement uncertainty of ±5.88 dB and above 1 GHz a measurement uncertainty of ±4.47 dB. The measurement uncertainty values for conducted and radiated emissions meet the requirements as expressed in CISPR 16-4-2. The equipment comprising the test systems is calibrated on an annual basis.

TEST EQUIPMENT

All measurement instrumentation is traceable to the National Institute of Standards and Technology and is calibrated to meet test method standard requirements and/or manufacturer's specifications
