UL Verification Services Inc. tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by UL Verification Services Inc. based on interpretations and/or observations of test results. Measurement Uncertainties were not taken into account and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

Note: The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. This document may not be altered or revised in any way unless done so by UL Verification Services Inc. and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL Verification Services Inc. will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, any agency of the Federal Government, or any agency of any government (NIST Handbook 150, Annex A). This report is written to support regulatory compliance of the applicable standards stated above.

4. SAR Measurement System & Test Equipment

4.1. SAR Measurement System

The DASY5 system used for performing compliance tests consists of the following items:

- A standard high precision 6-axis robot with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).
- An isotropic Field probe optimized and calibrated for the targeted measurement.
- A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- The Electro-optical converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. To use optical surface detection, a special version of the EOC is required. The EOC signal is transmitted to the measurement server.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
- A computer running WinXP or Win7 and the DASY5 software.
- Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc.
- The phantom, the device holder and other accessories according to the targeted measurement.

4.2. SAR Scan Procedure

Step 1: Power Reference Measurement

The Power Reference Measurement and Power Drift Measurements are for monitoring the power drift of the device under test in the batch process. The minimum distance of probe sensors to surface determines the closest measurement point to phantom surface. The minimum distance of probe sensors to surface is 2.1 mm. This distance cannot be smaller than the distance of sensor calibration points to probe tip as defined in the probe properties.

Step 2: Area Scan

The Area Scan is used as a fast scan in two dimensions to find the area of high field values, before doing a fine measurement around the hot spot. The sophisticated interpolation routines implemented in DASY software can find the maximum locations even in relatively coarse grids. When an Area Scan has measured all reachable points, it computes the field maximal found in the scanned area, within a range of the global maximum. The range (in dB) is specified in the standards for compliance testing. For example, a 2 dB range is required in IEEE Standard 1528 and IEC 62209 standards, whereby 3 dB is a requirement when compliance is assessed in accordance with the ARIB standard (Japan). If only one Zoom Scan follows the Area Scan, then only the absolute maximum will be taken as reference. For cases where multiple maximums are detected, the number of Zoom Scans has to be increased accordingly.

Area Scan Parameters extracted from KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz

	$\leq 3 \text{ GHz}$	$> 3 \text{ GHz}$
Maximum distance from closest measurement point (geometric center of probe sensors) to phantom surface	$5 \pm 1 \text{ mm}$	$\frac{1}{2} \cdot \delta \cdot \ln(2) \pm 0.5 \text{ mm}$
Maximum probe angle from probe axis to phantom surface normal at the measurement location	$30^\circ \pm 1^\circ$	$20^\circ \pm 1^\circ$
	$\leq 2 \text{ GHz}: \leq 15 \text{ mm}$ $2 - 3 \text{ GHz}: \leq 12 \text{ mm}$	$3 - 4 \text{ GHz}: \leq 12 \text{ mm}$ $4 - 6 \text{ GHz}: \leq 10 \text{ mm}$
Maximum area scan spatial resolution: $\Delta x_{\text{Area}}, \Delta y_{\text{Area}}$	When the x or y dimension of the test device, in the measurement plane orientation, is smaller than the above, the measurement resolution must be \leq the corresponding x or y dimension of the test device with at least one measurement point on the test device.	

Step 3: Zoom Scan

Zoom Scans are used to assess the peak spatial SAR values within a cubic averaging volume containing 1 g and 10 g of simulated tissue. The Zoom Scan measures points (refer to table below) within a cube whose base faces are centered on the maxima found in a preceding area scan job within the same procedure. When the measurement is done, the Zoom Scan evaluates the averaged SAR for 1 g and 10 g and displays these values next to the job's label.

Zoom Scan Parameters extracted from KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz

		≤ 3 GHz	> 3 GHz
Maximum zoom scan spatial resolution: Δx_{Zoom} , Δy_{Zoom}		≤ 2 GHz: ≤ 8 mm $2 - 3$ GHz: ≤ 5 mm*	$3 - 4$ GHz: ≤ 5 mm* $4 - 6$ GHz: ≤ 4 mm*
Maximum zoom scan spatial resolution, normal to phantom surface	uniform grid: $\Delta z_{Zoom}(n)$ graded grid	≤ 5 mm	$3 - 4$ GHz: ≤ 4 mm $4 - 5$ GHz: ≤ 3 mm $5 - 6$ GHz: ≤ 2 mm
		$\Delta z_{Zoom}(1)$: between 1 st two points closest to phantom surface	≤ 4 mm
		$\Delta z_{Zoom}(n>1)$: between subsequent points	$\leq 1.5 \cdot \Delta z_{Zoom}(n-1)$
Minimum zoom scan volume	x, y, z	≥ 30 mm	$3 - 4$ GHz: ≥ 28 mm $4 - 5$ GHz: ≥ 25 mm $5 - 6$ GHz: ≥ 22 mm

Note: δ is the penetration depth of a plane-wave at normal incidence to the tissue medium; see draft standard IEEE P1528-2011 for details.

* When zoom scan is required and the *reported* SAR from the area scan based *1-g SAR estimation* procedures of KDB 447498 is ≤ 1.4 W/kg, ≤ 8 mm, ≤ 7 mm and ≤ 5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

Step 4: Power drift measurement

The Power Drift Measurement measures the field at the same location as the most recent power reference measurement within the same procedure, and with the same settings. The Power Drift Measurement gives the field difference in dB from the reading conducted within the last Power Reference Measurement. This allows a user to monitor the power drift of the device under test within a batch process. The measurement procedure is the same as Step 1.

Step 5: Z-Scan (FCC only)

The Z Scan measures points along a vertical straight line. The line runs along the Z-axis of a one-dimensional grid. In order to get a reasonable extrapolation the extrapolated distance should not be larger than the step size in Z-direction.

4.3. Test Equipment

The measuring equipment used to perform the tests documented in this report has been calibrated in accordance with the manufacturers' recommendations, and is traceable to recognized national standards.

5. Measurement Uncertainty

Per KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz, when the highest measured 1-g SAR within a frequency band is < 1.5 W/kg, the extensive SAR measurement uncertainty analysis described in IEEE Std 1528-2013 is not required in SAR reports submitted for equipment approval.

1) The "Original Approval" power levels were based upon FCC modular approval testing of the BCM943602CS radio. These power levels were approved up to maximum regulatory levels to cover a number of different potential applications.

The original maximum regulatory power levels may be reduced further by the driver for one of the following two reasons:

- a) For performance (i.e. non-regulatory) reasons to ensure that PER and EVM of the radio meet internal specifications.
 - b) For application specifics. In this case the power is reduced to meet the specific SAR requirement per transmit chain over frequency band/channel. SAR specifics are addressed in a Class II permissive change as applicable.
- 2) The 11n 2Tx,3Tx HT20/HT40 "All" modes detailed apply to all of the CDD/STBC/SDM non-transmit beamforming modes.

1) The "Original Approval" power levels were based upon FCC modular approval testing of the BCM943602CS radio. These power levels were approved up to maximum regulatory levels to cover a number of different potential applications.

The original maximum regulatory power levels may be reduced further by the driver for one of the following two reasons:

a) For performance (i.e. non-regulatory) reasons to ensure that PER and EVM of the radio meet internal specifications.

b) For application specifics. In this case the power is reduced to meet the specific SAR requirement per transmit chain over frequency band/channel. SAR specifics are addressed in a Class II permissive change as applicable.

2) The 11n 2Tx,3Tx HT20/HT40 "All" modes detailed apply to all of the CDD/STBC/SDM non-transmit beamforming modes.

1) The "Original Approval" power levels were based upon FCC modular approval testing of the BCM943602CS radio. These power levels were approved up to maximum regulatory levels to cover a number of different potential applications.

The original maximum regulatory power levels may be reduced further by the driver for one of the following two reasons:

- a) For performance (i.e. non-regulatory) reasons to ensure that PER and EVM of the radio meet internal specifications.
 - b) For application specifics. In this case the power is reduced to meet the specific SAR requirement per transmit chain over frequency band/channel. SAR specifics are addressed in a Class II permissive change as applicable.
- 2) The 11n 2Tx,3Tx HT20/HT40 "All" modes detailed apply to all of the CDD/STBC/SDM non-transmit beamforming modes.

1) The "Original Approval" power levels were based upon FCC modular approval testing of the BCM943602CS radio. These power levels were approved up to maximum regulatory levels to cover a number of different potential applications.

The original maximum regulatory power levels may be reduced further by the driver for one of the following two reasons:

- a) For performance (i.e. non-regulatory) reasons to ensure that PER and EVM of the radio meet internal specifications.
 - b) For application specifics. In this case the power is reduced to meet the specific SAR requirement per transmit chain over frequency band/channel. SAR specifics are addressed in a Class II permissive change as applicable.
- 2) The 11n 2Tx,3Tx HT20/HT40 "All" modes detailed apply to all of the CDD/STBC/SDM non-transmit beamforming modes.

1) The "Original Approval" power levels were based upon FCC modular approval testing of the BCM943602CS radio. These power levels were approved up to maximum regulatory levels to cover a number of different potential applications.

The original maximum regulatory power levels may be reduced further by the driver for one of the following two reasons:

- a) For performance (i.e. non-regulatory) reasons to ensure that PER and EVM of the radio meet internal specifications.
 - b) For application specifics. In this case the power is reduced to meet the specific SAR requirement per transmit chain over frequency band/channel. SAR specifics are addressed in a Class II permissive change as applicable.
- 2) The 11n 2Tx,3Tx HT20/HT40 "All" modes detailed apply to all of the CDD/STBC/SDM non-transmit beamforming modes.

8. RF Output Power Measurement

8.1. Wi-Fi (2.4 GHz Band)

Output Power Measurement Considerations for Wi-Fi 2.4 GHz band

1. 2.4 GHz 802.11b DSSS:

- Output power measurement is not required:
 - o When SAR Test Exclusion according to KDB 447498 D01 applies.
 - o When other power measurement reduction applies.
- Otherwise, output power measurement is required on:
 - o Channels 1, 6, and 11, when the output power specified for other channels is no higher than the abovementioned channels.
 - o The closest adjacent channels to the aforementioned channels, when the output power specified for these adjacent channels is higher.
- For ease of identification, 802.11b DSSS is identified as the *Initial Test Configuration* for the 2.4 GHz band.

2. 2.4 GHz 802.11g/n OFDM

- Output power measurement is not required:
 - o When SAR Test Exclusion according to KDB 447498 D01 applies.
 - o When SAR Test Exclusion procedures for 2.4 GHz 802.11g/n OFDM applies, according to the SAR measurement results from 802.11b DSSS; see Section 11 of the report for details.
- Otherwise, output power measurement is required for 2.4 GHz 802.11g/n OFDM, with the following considerations:
 - o If 40 MHz bandwidth configurations are supported, measure power for either Channel 6 or the highest specified output power channel.
 - o Output power measurement requirements for smaller bandwidth configurations are dependent on the SAR measurement results from the 40 MHz bandwidth configurations.
 - o If no 40 MHz bandwidth configurations are supported, then a channel selection process similar to 802.11b DSSS is applied.
- The output power measurement is required for 2.4 GHz 802.11g/n OFDM as a result of 802.11b DSSS reported SAR results, the required test configurations in 2.4 GHz 802.11g/n OFDM are identified as *Subsequent Test Configurations* with respect to the *Initial Test Configuration* status assigned to 802.11b DSSS.
- If, for a particular antenna or transmit diversity condition supported by the device, no 802.11b DSSS configurations are available, output power should also be measured as a default for 802.11g/n OFDM when SAR Test Exclusion according to KDB 447498 D01 does not apply; these 802.11g/n OFDM configurations are considered the *Initial Test Configurations* for the respective antenna/transmit diversity condition.

8.2. Wi-Fi (5 GHz Bands)

Output Power Measurement Considerations for Wi-Fi 5 GHz bands

1. Frequency Band and Test Channel Considerations

- 5.15 – 5.25 and 5.25 – 5.35 GHz Bands (UNII Band 1 and UNII Band 2A)
 - o When SAR Test Exclusion according to KDB 447498 D01 does not apply, output power measurement is initially required for:
 - UNII 2A, if the output power specified for both bands are identical or higher on UNII 2A.
 - UNII 1, if higher output power is specified for UNII 1.
 - o Power must be measured at the highest and lowest channels in the frequency band, and also the mid-band channel when there are at least 3 channels.
 - o Output power measurement requirements for the remaining band are dependent on the SAR measurement results from the band initially tested; see Section 11 of the report for details
- 5.470 – 5.725, 5.725 – 5.825 GHz and 5.725 – 5.850 GHz Bands (UNII Band 2C and UNII 3)
 - o If both bands are ineligible for SAR Test Exclusion according to KDB 447498 D01 and the band gap channels between the two bands are supported, the frequency channels in UNII Band 2C from 5.65 GHz and above must be considered with UNII 3 for the sake of SAR measurement accuracy.
 - o Taking into account the grouping of frequency channels described above, output power is then measured at the highest, lowest and mid-band (where applicable) channels accordingly.

2. Test Mode and Configuration Considerations

- Within a frequency band that requires output power measurements, the process of choosing an initial mode for measurement is as follows:
 - o The mode and bandwidth configuration with the highest specified output power is prioritized.
 - o If the output power specified is the same across all modes and bandwidth configurations, the mode with the highest bandwidth is chosen.
 - o If a test mode cannot be identified with the two criteria listed above, the mode with the lowest order modulation is chosen.
 - o If a test mode still cannot be decided, then the mode with the lowest data rate is chosen.
 - o The mode that is chosen from this process is identified as the Initial Test Configuration
- Output power measurement requirements for other modes are dependent on the SAR measurement results from the initial mode of measurement (see Section 11 of the report for details); if SAR measurement is required for a subsequent mode/configuration, the following should be considered:
 - o The same process in choosing the Initial Test Configuration is applied again to choose the next configuration; this is identified as the Subsequent Test Configuration.
 - o If the Subsequent Test Configuration is of lower bandwidth than the Initial Test Configuration, power should be measured on all channels that overlap with the channels in the Initial Test Configuration that incurred testing for the Subsequent Test Configurations.

9. Dielectric Property Measurements

The temperature of the tissue-equivalent medium used during measurement must also be within 18°C to 25°C and within $\pm 2^\circ\text{C}$ of the temperature when the tissue parameters are characterized.

The dielectric parameters must be measured before the tissue-equivalent medium is used in a series of SAR measurements. The parameters should be re-measured after each 3 – 4 days of use; or earlier if the dielectric parameters can become out of tolerance; for example, when the parameters are marginal at the beginning of the measurement series.

Tissue dielectric parameters were measured at the low, middle and high frequency of each operating frequency range of the test device.

10. System Check

SAR system verification is required to confirm measurement accuracy, according to the tissue dielectric media, probe calibration points and other system operating parameters required for measuring the SAR of a test device. The system verification must be performed for each frequency band and within the valid range of each probe calibration point required for testing the device. The same SAR probe(s) and tissue-equivalent media combinations used with each specific SAR system for system verification must be used for device testing. When multiple probe calibration points are required to cover substantially large transmission bands, independent system verifications are required for each probe calibration point. A system verification must be performed before each series of SAR measurements using the same probe calibration point and tissue-equivalent medium. Additional system verification should be considered according to the conditions of the tissue-equivalent medium and measured tissue dielectric parameters, typically every three to four days when the liquid parameters are remeasured or sooner when marginal liquid parameters are used at the beginning of a series of measurements.

10.1. Reference Target SAR Values

The reference SAR values can be obtained from the calibration certificate of system validation dipoles

11. SAR Test Results

SAR Test Reduction criteria are as follows:

Initial Test Position SAR Test Reduction

For both DSSS and OFDM wireless modes, when an Initial Test Configuration is found to require SAR measurements, an Initial Test Position is established for each applicable exposure configuration (Head, Body, etc.) using either:

- Design implementation details from the manufacturer, or
- Investigative results by the test lab, obtained by performing area scans on the Initial Test Configuration for all applicable test positions and identifying the highest measured SAR from the area scan-only measurements.

Complete SAR scans are then performed on the established Initial Test Position on each exposure configuration, using the Initial Test Configuration. When the reported SAR for this Initial Test Position is:

- $\leq 0.4 \text{ W/kg}$, further SAR measurement is not required for the other test positions in the exposure configuration and wireless mode combination within the frequency band or aggregated band.
- $> 0.4 \text{ W/kg}$, SAR is repeated using the same wireless mode test configuration tested in the initial test position to measure the subsequent next closest/smallest test separation distance and maximum coupling test position, on the highest maximum output power channel until the reported SAR is $\leq 0.8 \text{ W/kg}$ or all required test positions are tested.
- For all positions/configurations tested using the initial test position and subsequent test positions, when the reported SAR is $> 0.8 \text{ W/kg}$, measure the SAR for these test positions/configurations on the subsequent next highest measured output power channel(s) until the reported SAR is $\leq 1.2 \text{ W/kg}$ or all required test channels are considered.

SAR Test Reduction for OFDM using Initial Test Configuration Procedures

Along with the Initial Test Position test reduction guidelines, the following procedures are also applied to streamline SAR measurement requirements when multiple OFDM configurations are supported:

1. When the reported SAR for the highest output power channel in the Initial Test Configuration is $> 0.8 \text{ W/kg}$, SAR measurement is required for the next highest measured output power channel in the Initial Test Configuration until the reported SAR is $\leq 1.2 \text{ W/kg}$ or all required channels are tested.
2. For Subsequent Test Configurations with output power $\leq 0.5 \text{ dB}$ lower than the Initial Test Configuration:
 - No further SAR measurement is required for the exposure condition and frequency band or aggregated band combination in the Subsequent Test Configurations when the reported SAR from the Initial Test Configuration is $\leq 0.8 \text{ W/kg}$.
 - SAR is required in the Subsequent Test Configurations for all conditions in the Initial Test Configuration and subsequent test positions with reported SAR > 0.8 and $\leq 1.2 \text{ W/kg}$, using the following criteria for test channel selection:
 - o The highest measured output channel in the Subsequent Test Configurations, if the measured output power is different among channels.
 - o The channel closest to the center frequency of the larger bandwidth configuration channel- assuming a larger bandwidth configuration was established as the Initial Test Configuration- if the output power measured across the channels in the Subsequent Test Configuration is the same.
 - o SAR measurement for the subsequent highest powered channel in the Subsequent Test Configurations is required only when the reported SAR from the initial measurement in the Subsequent Test Configuration is $> 1.2 \text{ W/kg}$.

SAR Test Reduction for OFDM using Initial Test Configuration Procedures (continued)

3. For Subsequent Test Configurations with output power > 0.5 dB lower than the Initial Test Configuration, SAR measurement is not required for exposure condition and frequency band or aggregated band combinations with highest reported SAR $\leq 1.2 \text{ W/kg}$ in the Initial Test Configuration measurements.
4. When the highest reported SAR for the Initial Test Configuration is $> 1.2 \text{ W/kg}$, the Initial Test Configuration SAR measurement procedure is applied to the Subsequent Test Configuration.
 - The highest output power channel for the initial measurement, as well as the number of potentially required test channels, is determined by the channel bandwidth support in the Subsequent Test Configuration.
 - Additional output power measurements may be required.
 - The test channel reduction threshold for Subsequent Test Configuration is decreased from the usual $> 1.2 \text{ W/kg}$ to $> 0.8 \text{ W/kg}$.
5. Beyond the Subsequent Test Configuration, SAR measurement requirements for the remaining transmission modes are determined by applying the Subsequent Test Configuration in the following manner:
 - Replace Subsequent Test Configuration with Next Subsequent Test Configuration.
 - Replace Initial Test Configuration with Preceding Test Configuration

SAR Test Reduction for Wi-Fi 2.4 GHz

1. 2.4 GHz 802.11b DSSS:
 - When the reported SAR of the highest maximum output channel for the exposure configuration is $\leq 0.8 \text{ W/kg}$, no further testing is required for that exposure configuration for 802.11b DSSS.
 - When the reported SAR is $> 0.8 \text{ W/kg}$, SAR is required for the next highest measured output channel in that exposure configuration. When any reported SAR is $> 1.2 \text{ W/kg}$, SAR is required for the 3rd channel; i.e., all channels require testing.
2. 2.4 GHz 802.11g/n OFDM:
 - SAR is not required for 802.11g/n OFDM when its specified output power is $\geq 1 \text{ dB}$ lower than that specified for 802.11b DSSS and the highest reported SAR for 802.11b DSSS is $\leq 1.2 \text{ W/kg}$.
 - SAR not required for 802.11g/n OFDM when its specified output power is $\leq 0.25 \text{ dB}$ higher and $< 1 \text{ dB}$ lower than that specified 802.11b DSSS and the highest reported SAR for 802.11b DSSS is $\leq 0.8 \text{ W/kg}$.

SAR Test Reduction for Wi-Fi 5 GHz bands

1. 5.15 – 5.25 and 5.25 – 5.35 GHz Bands (UNII Band 1 and UNII Band 2A)
 - With respect to the Initial Test Configuration and Initial Test Position procedures, SAR is initially measured for:
 - o UNII Band 2A, if the output power specified for both bands is the same or higher on UNII Band 2A.
 - o UNII Band 1, if it has the higher specified output power of the two bands.
 - If the highest reported SAR from the initially measured band is:
 - o $\leq 1.2 \text{ W/kg}$, SAR is not required for the remaining band.
 - o $> 1.2 \text{ W/kg}$, and the difference in specified output power is $\leq 1 \text{ dB}$, both bands should be tested independently for SAR; otherwise, the Initial Test Configuration and Initial Test Position procedures should be applied.

SAR Test Reduction for Wi-Fi 5 GHz bands (continued)

2. 5.470 – 5.725, 5.725 – 5.825 GHz and 5.725 – 5.850 GHz Bands (UNII Band 2C and UNII 3)
 - If TDWR restriction does not apply:
 - o The channels in the frequency range of 5.60 – 5.65 GHz should be considered for testing.
 - If TWDR restriction does not apply, and the band gap channels between the two bands are supported:
 - o The channels in UNII Band 2C above 5.65 GHz are then grouped with the channels in UNII Band 3.
 - o Evaluation for test requirements is performed independently for each band according to the grouping of channels described above.
 - The Initial Test Configuration and Initial Test Position procedures are then applied independently for each band.
 - o Unlike UNII Band 1 and UNII Band 2A, test reduction or exclusion is not interdependent between UNII Band 2C and UNII Band 3.

12. SAR Measurement Variability

In accordance with published RF Exposure KDB procedure 865664 D01 SAR measurement 100 MHz to 6 GHz. These additional measurements are repeated after the completion of all measurements requiring the same head or body tissue-equivalent medium in a frequency band. The test device should be returned to ambient conditions (normal room temperature) with the battery fully charged before it is re-mounted on the device holder for the repeated measurement(s) to minimize any unexpected variations in the repeated results.

- 1) Repeated measurement is not required when the original highest measured SAR is < 0.80 W/kg; steps 2) through 4) do not apply.
- 2) When the original highest measured SAR is ≥ 0.80 W/kg, repeat that measurement once.
- 3) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is > 1.20 or when the original or repeated measurement is ≥ 1.45 W/kg ($\sim 10\%$ from the 1-g SAR limit).
- 4) Perform a third repeated measurement only if the original, first or second repeated measurement is ≥ 1.5 W/kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is > 1.20 .

Note(s):

1. Second Repeated Measurement is not required since the ratio of the largest to smallest SAR for the original and first repeated measurement is not > 1.20 .

13. Simultaneous Transmission SAR Analysis

KDB 447498 D01 General RF Exposure Guidance introduces a new formula for calculating the SAR to Peak Location Ratio (SPLSR) between pairs of simultaneously transmitting antennas:

$$SPLSR = (SAR_1 + SAR_2)^{1.5} / Ri$$

Where:

SAR₁ is the highest measured or estimated SAR for the first of a pair of simultaneous transmitting antennas, in a specific test operating mode and exposure condition

SAR₂ is the highest measured or estimated SAR for the second of a pair of simultaneous transmitting antennas, in the same test operating mode and exposure condition as the first

Ri is the separation distance between the pair of simultaneous transmitting antennas. When the SAR is measured, for both antennas in the pair, it is determined by the actual x, y and z coordinates in the 1-g SAR for each SAR peak location, based on the extrapolated and interpolated result in the zoom scan measurement, using the formula of $[(x_1-x_2)^2 + (y_1-y_2)^2 + (z_1-z_2)^2]$

A new threshold of 0.04 is also introduced in the draft KDB. Thus, in order for a pair of simultaneous transmitting antennas with the sum of 1-g SAR > 1.6 W/kg to qualify for exemption from Simultaneous Transmission SAR measurements, it has to satisfy the condition of:

$$(SAR_1 + SAR_2)^{1.5} / Ri < 0.04$$
