1.3 Details of applicant

Name : **Itronix Coporation**
Street : **804 South Stevens St.**
City / Zip Code : **Spokane, WA 99204**
Country : **USA**
Contact : **Mr. Richard Sargent**
Telephone : **509-742-1253**
Tele-fax : **509-742-1672**
e-mail : sargent@itronix.com

1.4 Application details

Date of receipt of application : 2003-03-05
Date of receipt test item : 2003-03-05
Date of test : 2003-03-13, 2003-03-19 & 2003-04-05

1.5 Test item

Manufacturer : **Itronix**
Model No. : **IX-550**
Description : [Ruggedized Laptop with GSM/GPRS radios](#)
HW & SW
FCC-ID : **KBCIX550AC750**

Additional information

Frequency : GSM 900/1800/1900 MHz
Type of modulation : GMSK
Number of channels : 299 (in PCS 1900)
Antenna : Whip; Monopole
Power supply : 5.0Vdc
Output power : Maximum Output Power 0.6W (27.64dBm) EIRP.
Extreme vol. Limits : Lower Limit: 4.5Vdc
Nominal Voltage: 5.5.Vdc
Upper Limit: 5.5Vdc
Extreme temp. Tolerance : Lower Limit: -20°C
Upper Limit: 60°C

1.6 Test standards

FCC Part 24 / RSS133 r1

2 Technical test**2.1 Summary of test results**

No deviations from the technical specification(s) were ascertained in the course of the tests

**Test report no.: EMC439FCC24/2003
(IX-550)**

TEST REPORT REFERENCE

PARAMETER TO BE MEASURED	PARAGRAPH	PAGE
POWER OUTPUT	SUBCLAUSE § 24.232	7
FREQUENCY STABILITY	SUBCLAUSE § 24.235	9
OCCUPIED BANDWIDTH	SUBCLAUSE §2.989	11
EMISSIONS LIMITS	SUBCLAUSE§24.238	18
RECEIVER RADIATED EMISSIONS	SUBCLAUSE § 15.209	36
CONDUCTED SPURIOUS EMISSIONS	SUBCLAUSE § 24.238	41
CONDUCTED EMISSIONS	SUBCLAUSE § 15.107/207	50
TEST EQUIPMENT AND ANCILLARIES USED FOR TESTS		52
BLOCK DIAGRAMS		53

POWER OUTPUT**SUBCLAUSE § 24.232(b)****Summary:**

This paragraph contains both average and peak conducted output power measurements for the EUT.
In any case, the peak output power comply with the specified limits

Limits:

Power Step	Nominal Peak Output Power (dBm)	Tolerance (dB)
0	+30	± 2

According GSM specifications**Power Measurements:****Conducted:**

Frequency (MHz)	Power Step	Peak Output Power (dBm)	Average Output Power during burst (dBm)
1850.2	0	28.02	18.78
1880.0	0	27.64	18.40
1909.8	0	27.77	18.53
Measurement uncertainty		±0.5 dB	

ANALYZER SETTINGS: RBW = 3MHz VBW = 3MHz

EIRP

Note: EIRP is calculated value from the measured Antenna Gain

Antenna gain - calculated from the difference of conducted power and EIRP measured with Sierra Wireless card AC555.

Frequency (MHz)	Antenna Gain (dBi)
1850.2	-0.25
1880.0	1.08
1909.8	-1.74
average	-0.38

In any case, the peak output power comply with the specified limits

Limits:

Power Step	Peak Power EIRP (dBm)
0	≤30

Max. output power according the GSM specification

Radiated:

For the EIRP calculation the real values at the relevant frequencies (see antenna gain table above) were used.

Frequency (MHz)	Power Step	Peak Output Power (dBm)	
		EIRP	ERP
1850.2	0	27.95	25.85
1880.0	0	28.72	26.62
1909.8	0	26.03	23.93
Measurement uncertainty		±0.5 dB	

FREQUENCY STABILITY**§2.1055 / § 24.235****Method of Measurement:**

In order to measure the carrier frequency under the condition of AFC lock, it is necessary to make measurements with the EUT in a "call mode". This is accomplished with the use of a R&S CMD 55 DIGITAL RADIO COMMUNICATION TESTER.

1. Measure the carrier frequency at room temperature.
2. Subject the EUT to overnight soak at -30 C.
3. With the EUT, powered via nominal voltage, connected to the CMD 55 and in a simulated call on channel 661 (centre channel), measure the carrier frequency. These measurements should be made within 2 minutes of powering up the EUT, to prevent significant self warming.
4. Repeat the above measurements at 10 C increments from -30 C to +50 C. Allow at least 1 1/2 hours at each temperature, un-powered, before making measurements.
5. Re-measure carrier frequency at room temperature with nominal voltage. Vary supply voltage from minimum voltage to maximum voltage, in 0.1 Volt increments re-measuring carrier frequency at each voltage. Pause at nominal voltage for 1 1/2 hours unpowered, to allow any self-heating to stabilize, before continuing.
6. Subject the EUT to overnight soak at +50 C.
7. With the EUT, powered via nominal voltage, connected to the CMD 55 and in a simulated call on channel 661 (centre channel), measure the carrier frequency. These measurements should be made within 2 minutes of Powering up the EUT, to prevent significant self-warming.
8. Repeat the above measurements at 10 C increments from +50 C to -30 C. Allow at least 1 1/2 hours at each temperature, unpowered, before making measurements.
9. At all temperature levels hold the temperature to +/- 0.5 C during the measurement procedure.

Measurement Limit:**For Hand carried battery powered equipment:**

According to the JTC standard the frequency stability of the carrier shall be accurate to within 0.1 ppm of the received frequency from the base station. This accuracy is sufficient to meet Sec. 24.235, Frequency Stability. The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block. As this transceiver is considered "Hand carried, battery powered equipment" Section 2.1055(d)(2) applies. This requires that the lower voltage for frequency stability testing be specified by the manufacturer. This transceiver is specified to operate with an input voltage of between 4.5VDC and 5.5VDC, with a nominal voltage of 5.5.VDC. Operation above or below these voltage limits is prohibited by transceiver software in order to prevent improper operation as well as to protect components from overstress. These voltages represent a tolerance of -0.18% and +0.0%. For the purposes of measuring frequency stability these voltage limits are to be used.

AFC FREQ ERROR vs. VOLTAGE

Frequency = 1800MHz

Voltage (V)	Frequency Error (Hz)	Frequency Error (ppm)
3.1 volt	-4.58	-0.0025
3.3 volt	-3.55	-0.0020
3.5 volt	-1.87	-0.0010
4.5 volt	-28.02	-0.0156
4.7 volt	-11.11	-0.0062
4.9 volt	-15.37	-0.0085
5.0 volt	-16.21	-0.0090
5.1 volt	-11.69	-0.0065
5.3 volt	-14.21	-0.0079
5.5 volt	-19.44	-0.0108

AFC FREQ ERROR vs. TEMPERATURE

TEMPERATURE (°C)	Frequency Error (Hz)	Frequency Error (ppm)
-30	-76.7	-0.0426
-20	-47.14	-0.0262
-10	-39.45	-0.0219
0	-24.99	-0.0139
+10	-16.08	-0.0089
+20	-16.21	-0.0090
+30	-10.59	-0.0059
+40	-6.72	-0.0037
+50	-24.47	-0.0136

OCCUPIED BANDWIDTH**§24.238(b)****Occupied Bandwidth Results**

Similar to conducted emissions; occupied bandwidth measurements are only provided for selected frequencies in order to reduce the amount of submitted data. Data were taken at the extreme and mid frequencies of the USPCS frequency band. Table below lists the measured 99% power and -26dBC occupied bandwidths.

Frequency	99% Occupied Bandwidth (KHz)	-26 dBc Bandwidth (KHz)
1850.2 MHz	270.54	318.63
1880.0 MHz	280.56	314.62
1909.2 MHz	280.56	312.62

Part 24.238 (a) requires a measurement bandwidth of at least 1% of the –26dBc occupied bandwidth. The worst case of –26dBc is 318.63 kHz and 1% of this equates to a resolution bandwidth of at least 3.18kHz. Therefore, resolution bandwidth 3.0 kHz was used in Part 24.238(a).

Channel 512

99% Occupied Bandwidth

Date: 8.NOV.01 19:15:10

Channel 512 -26 dBc Bandwidth

Date: 8.NOV.01 19:12:59

Channel 661 99% Occupied Bandwidth

Date: 8.NOV.01 19:20:25

Channel 661 -26 dBc Bandwidth

Date: 8.NOV.01 19:18:05

Channel 810 99% Occupied Bandwidth

Date: 8.NOV.01 19:27:08

Channel 810 -26 dBc Bandwidth

Date: 8.NOV.01 19:24:35

EMISSIONS LIMITS**§24.238****Measurement Procedure:**

The following steps outline the procedure used to measure the radiated emissions from the EUT. The site is constructed in accordance with ANSI C63.4 – 1992 requirements and is recognised by the FCC. The spectrum was scanned from 30 MHz to the 10th harmonic of the highest frequency generated within the equipment, which is the transmitted carrier that can be as high as 1910 MHz. The resolution bandwidth is set as outlined in Part 24.238. The spectrum was scanned with the mobile station transmitting at carrier frequencies that pertain to low, mid and high channels of the USPCS band.

The final Radiated emission test procedure is as follows:

- a) The test item was placed on a 0.8 meter high non-conductive stand at a 3 meter test distance from the receive antenna.
- b) A double-ridged wave-guide antenna was placed on an adjustable height antenna mast 3 meters from the test item for emission measurements.
- c) Detected emissions were maximized at each frequency by rotating the test item and adjusting the receive antenna height and polarization. The maximum meter reading was recorded. The radiated emission measurements of all non-harmonic and harmonics of the transmit frequency through the 10th harmonic were measured with peak detector and 1MHz bandwidth. If the harmonic could not be detected above the noise floor, the ambient level was recorded. The equivalent power into a dipole antenna was determined by the substitution method described for EIRP measurements.

Measurement Limit:

Sec. 24.238 Emission Limits.

- (a) On any frequency outside a licensee's frequency block (e.g. A, D, B, etc.) within the USPCS spectrum, the power of any emission shall be attenuated below the transmitter power (P , in Watts) by at least $43 + 10 \log(P)$ dB. The specification that emissions shall be attenuated below the transmitter power (P) by at least $43 + 10 \log(P)$ dB, translates in the relevant power range (1 to 0.001 W) to -13 dBm. At 1 W the specified minimum attenuation becomes 43 dB and relative to a 30 dBm (1 W) carrier becomes a limit of -13 dBm. At 0.001 W (0 dBm) the minimum attenuation is 13 dB which again yields a limit of -13 dBm. In this way a translation of the specification from relative to absolute terms is carried out.

Measurement Results:

Radiated emissions measurements were made only at the upper, middle, and lower carrier frequencies of the USPCS band (1850.2 MHz, 1880 MHz and 1909.8 MHz). It was decided that measurements at these three carrier frequencies would be sufficient to demonstrate compliance with emissions limits because it was seen that all the significant spurs occur well outside the band and no radiation was seen from a carrier in one block of the USPCS band into any of the other blocks. The equipment must still, however, meet emissions requirements with the carrier at all frequencies over which it is capable of operating and it is the manufacturer's responsibility to verify this.

NOTE: The spurious emissions were done with different settings, using the relevant pre-amplifiers for the relevant frequency ranges. For this reason the graphs show different noise levels.

RESULTS OF RADIATED TESTS FOR FCC-24:

Harmonic	Tx 1850.2 Freq.(MHz)	Level (dBm)	Tx 1880.0 Freq. (MHz)	Level (dBm)	Tx 1909.8 Freq. (MHz)	Level (dBm)

TEST EQUIPMENT AND ANCILLARIES USED FOR TESTS

No	Instrument/Ancillary	Type	Manufacturer	Serial No.
01	Spectrum Analyzer	ESIB 40	Rohde & Schwarz	100107
02	Spectrum Analyzer	FSEM 30	Rohde & Schwarz	826880/010
03	Signal Generator	SMY02	Rohde & Schwarz	836878/011
04	Power-Meter	NRVD	Rohde & Schwarz	0857.8008.02
05	Power Amplifier	250W1000	Amplifier Research	300031
06	Biconilog Antenna	3141	EMCO	0005-1186
07	Horn Antenna	SAS-200/571	AH Systems	325
08	Power Splitter	11667B	Hewlett Packard	645348
09	Climatic Chamber	VT4004	Votch	G1115
10	Pre-Amplifier	JS4-00102600	Miteq	00616
11	Power Sensor	URV5-Z2	Rohde & Schwarz	DE30807
12	Digital Radio Comm. Tester	CMD-55	Rohde & Schwarz	847958/008
