# **RF Exposure Evaluation**

## Limits

Limits for Maximum Permissible Exposure (MPE)

f = frequency in MHz

Friis transmission formula: Pd = (Pout\*G)/(4\*pi\*r<sup>2</sup>)

#### Where

Pd = power density in mW/cm<sup>2</sup>, Pout = output power to antenna in mW;

G = gain of antenna in linear scale, Pi = 3.1416;

R = distance between observation point and center of the radiator in cm

Pd id the limit of MPE, 1 mW/cm<sup>2</sup>. If we know the maximum gain of the antenna and the total power input to the antenna, through the calculation, we will know the distance r where the MPE limit is reached.

#### **Test Procedure**

Software provided by client enabled the EUT to transmit and receive data at lowest, middle and highest channel individually.

### **Test Result of RF Exposure Evaluation**

Band	Frequency	Max output power (dBm)	Output power (mW)	Antenna gain (dBi)	Power Density at R=20cm (mW/cm <sup>2</sup> )	Limit (mW/cm <sup>2</sup> )	Verdict
LORA	903MHz	15.27	33.65	2.2	0.0111	0.602	-
WIFI2.4G	2412MHz	18.02	63.39	1.8	0.0190	1.0	Pass

LORA and WIFI Simultaneous Transmission:

$$\sum_{k=1}^{c} \frac{Evaluated_k}{Exposure\ Limit_k}$$

LORA+2.4G WIFI =(0.0111/0.602)+(0.0190/1) = 0.0184+0.0190=0.037<1

The max power density is less than MPE exempt limit, so it is compliance.
