Suite 100 PO Box 9040

Melville, NY 11747

Testing

NVLAP Lab Code: 600110

Document Introduction

Honeywell tested the above equipment in accordance with the requirements set forth in the listed standards. All indications of Pass/Fail in the report are opinions expressed by Honeywell based on interpretations and/or observations of test results. Measurement Uncertainties were not taken into account and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

This document is a record of the FCC/IC Test Report for Honeywell products. It demonstrates the data required to be analyzed to certify a product according to the requirements of the FCC & IC.

The results in the report reflect only the model of the items under test unless noted otherwise. This document may not be altered or revised in any way unless done so by Honeywell and all revisions are duly noted in the revisions section. Any alterations of this document not carried out by Honeywell will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval or endorsement by NVLAP, NIST, any agency of the Federal Government, or any agency of any government.

Facilities and Accreditation

The test site and measurement facility used to collect data are located at 2 Corporate Center Dr., Melville, NY 11747, USA. Honeywell International is accredited by NVLAP, Laboratory Code 600110-0. The full scope of accreditation can be viewed at the NVLAP website.

Test Item Description

The 5800FLOOD is a water leak detector and ambient temperature monitor device, based on 5800 RF Protocol. The EUT is a periodic operator, which transmits at 344.94MHz.

Worse-Case Configuration & Mode

Radiated emissions was performed with the EUT set to transmit at the highest output power as worst-case scenario. The EUT was tested in the two orthogonal planes by which it can be installed in order to determine the worst-case emissions. It was determined that the orientation standing upright was the worst-case orientation. Therefore, all final radiated test was performed with the EUT standing upright.

Test Sample Identification

Sample ID Number	Sample Serial Number	Date Received
MEL-182	Non-serialized production unit	2/13/17
MEL-183	Non-serialized production unit	2/13/17

Calibration & Measurement Uncertainty

- Measuring Instrument Calibration – The measuring equipment utilized to perform the tests documented in this report have been calibrated in accordance with the manufacturer’s recommendations and is traceable to recognized national standards.
- Sample Calculation – Where relevant, the following sample calculation is provided:

Field Strength (dBuV/m) = Measured Voltage (dBuV) + Antenna Factor (dB/m) + Cable Loss (dB) – Preamp Gain (dB)

[i.e.] 37 dBuV/m = 30 dBuV + 18.5 dB/m + 0.5 dB – 12 dB

- Uncertainty - Figures are valid to a confidence level of 95%.

Test	Standard Uncertainty
Radiated Emissions (30-200MHz Horizontal)	+/- 5.05 dB
Radiated Emissions (30-200MHz Vertical)	+/- 5.28 dB
Radiated Emissions (200-1000MHz Horizontal)	+/- 10.21 dB
Radiated Emissions (200-1000MHz Vertical)	+/- 10.36 dB
Radiated Emissions (Above 1GHz)	+/- 9.70 dB
Conducted Emissions (150KHz-30MHz)	+/- 4.36 dB

Opinions / Interpretations

None

Test Summary

All tests described below are required, unless otherwise noted. Notes should be described in detail in the "Additional notes" section.

#	Test Description	Status
1	20 dB Occupied Bandwidth	PASS
2	99% Bandwidth	PASS
3	Radiated Emissions (Intentional)	PASS
4	Radiated Emissions (Unintentional)	PASS

20dB Occupied Bandwidth

Test Description

Measure the maximum width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 20 dB relative to the maximum level measured in the fundamental emission.

Test Limit

Reference	Limit
CFR 47 Subpart C 15.231 (c)	< 0.25% of the Center Frequency

Test Results

Frequency (MHz)	20dB Bandwidth (in kHz)
344.94	108.24

Plots

99% Bandwidth

Test Description

The emission bandwidth (x dB) is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated x dB below the maximum in-band spectral density of the modulated signal. Spectral density (power per unit bandwidth) is to be measured with a detector of resolution bandwidth in the range of 1% to 5% of the anticipated emission bandwidth, and a video bandwidth at least 3x the resolution bandwidth.

When the occupied bandwidth limit is not stated in the applicable RSS or reference measurement method, the transmitted signal bandwidth shall be reported as the 99% emission bandwidth, as calculated or measured.

Radiated Emissions (Unintentional Radiator)

Test Description

The Radiated Emissions (Unintentional Radiator) measurement is a test of the whole UUT during normal operation. It is a Radiated Emissions measurement done on the UUT from 30 MHz to 1 GHz, typically done in a 3 meter anechoic chamber. The UUT is positioned on a turntable in the manner for which the device will be normally used, with all peripherals connected in idle, with all cables typically used with the UUT dressed appropriately. A scan is taken, and checked if it passes over the limits as shown in FCC Part 15.109 / ICES-003.

Test Criteria

Radiated Emissions (Intentional Radiator)

Test Description

Intentional Radiator Radiated Emissions are a test of the emissions, and harmonics on the UUT. The UUT is positioned to get the maximum emissions after a series of prescan measurements.

The EUT is placed on a non-conducting table 80 cm above the ground plane for below 1 GHz measurements and 1.5 m above the ground plane for above 1 GHz measurements. The antenna to EUT distance is 3 meters.

For measurements below 1 GHz the resolution bandwidth is set to 120 kHz for peak detection measurements or 120 kHz for quasi-peak detection measurements. Peak detection is used unless otherwise noted as quasi-peak.

For measurements above 1 GHz the resolution bandwidth is set to 1 MHz; the video bandwidth is set to 1 MHz for peak measurements and as applicable for average measurements.

The spectrum from 30 MHz to 26 GHz is investigated with the transmitter set to the lowest, middle, and highest channels in each applicable band.

The EUT is rotated through 360 degrees to maximize emissions received. The antenna is scanned from 1 to 4 meters above the ground plane to further maximize the emission. Measurements are made with the antenna polarized in both the vertical and the horizontal positions.

Test Criteria

Reference	Limit		
	Frequency Range	Field Strength Limit (uV/m) at 3M	Field Strength Limit (dBuV/m) at 3M
CFR 47 Subpart C, 15.205 CFR 47 Subpart C, 15.209 RSS-GEN	30-88	100	40
	88-216	150	43.5
	216-960	200	46
	Above 960	500	54

Reference	Limit		
	Fundamental Frequency (MHz)	Field Strength of Fundamental (uV/m)	Field Strength of Spurious Emissions (uV/m)
CFR 47 Subpart C, 15.231 (b) RSS-210 (a)	40.66-40.70	2250	225
	70-130	1250	125
	130-174	1250 to 3750	125 to 375
	174-260	3750	375
	260-470	3750 to 12500	375 to 1250
	Above 470	12500	1250

Message Timing & Duty Cycle

Per Exhibit 3, the declared worse-case duty cycle that the EUT will be limited to will be 10%. Hence, a duty-cycle (DC) correction factor as described in FCC Part 15, Section 15.35(c) and RSS-GEN 6.10 was used to calculate an average value as follows:

Average value [dBuV/m] = Peak value [dBuV/m] + 20*log (DC/100)

Average value [dBuV/m] = Peak value [dBuV/m] + 20*log (10/100)

Average value [dBuV/m] = Peak value [dBuV/m] – 20dB
