

## FCC ID:2BBFL-MAX70

## **RF** Exposure evaluation

According to 447498 D01 General RF Exposure Guidance v06

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation

distances  $\leq$  50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance,

mm)]  $\cdot [\sqrt{f(GHz)}] \le 3.0$  for 1-g SAR and  $\le 7.5$  for 10-g extremity SAR, where

f(GHz) is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest mW and mm before calculation

The result is rounded to one decimal place for comparison

Here,

	MIMO	Tune-up	Max		Min.	Cala	
	Power	power	Power		Distance	Calc.	
Mode	(dBm)	(dBm)	(mW)	Frequency(MHz)	(mm)	thresholds	limit
BT	0.28	0±1	1.26	2480	5	0.3968	3.0

So a SAR test is not required
