Efficiency & Peak Gain

	Frequency (MHz)	2400	2450	2500	Avg.
Ant.0	Efficiency	55%	58%	57%	57%
	Average gain (dBi)	-2.60	-2.37	-2.44	
	Peak gain (dBi)	0.54	0.77	1.13	
	Peak Gain@	Theta= -152° Phi=110°	Theta= 118° Phi=129°	Theta= 113° Phi=135°	
Ant.1	Efficiency	60	63	61	61%
	Average gain (dBi)	-2.22	-2.01	-2.15	
	Peak gain (dBi)	0.03	0.02	0.23	
	Peak Gain@	Theta= 28° Phi=82°	Theta= 31° Phi=82°	Theta= 31° Phi=79°	

The above peak gain was measured at the above angle using the substitution method.

The substitution method involves setting up our calibrated reference antenna over a radiated path across the chamber, then normalizing (or "zeroing") that path loss to 0 dB.

Then we substitute our antenna in place of our reference antenna, and re-measure the change in path loss. By simply adding our reference antenna's calibrated gain (in dBi) to the change in path loss, to determine the antenna gain in dBi.

Measurement Setup & Test Method

SG 64 uses analog RF signal generators to emit EM waves from the probe array to the antenna under test (AUT) or vice versa.

It uses the NPAC as an RF receiver for antenna measurements. The NPAC also drives the electronic scanning of the probe array.

WNC

The NPAC includes the fastest and most accurate sources and receivers on the market.

Test Procedure & SW

- Place the device at the center of the chamber.
- Connect the antenna cable to RF cable of the chamber
- Run Satimotest SW (NPAC Spherical Measurement, v1.5.4 (GIT E6965664)) which is Satimo's proprietary SW.
- Get 3D data in 2.8125 degree step from phi 0°~360° and theta 90° ~ +90°, including efficiency, peak gain, 2D & 3D radiation pattern.
- This is passive measurement, which means the device is off and not in any operating mode.
