## Equipment Under Test (EUT)

Trade mark: Silicon Labs  
Model: MGM13S12N, MGM13S12A, MGM13S02N, MGM13S02A  
Type: Multi-Protocol Wireless Module  
Serial no: -  
FCC ID: QOQ13  
IC: 5123A-13

## Description of the EUT

MGM13S is a multi-protocol wireless module with two antenna variants. Variant A is equipped with chip antenna while the N variant has RF pin for the use of external antenna.

This test report contains test results for ZigBee.

## Classification of the device

## Ratings and declarations

Operating Frequency Range (OFR): 2405 - 2480 MHz  
Channels: 16  
Channel separation: 5 MHz  
Effective conducted power: 18.38 dBm (Peak)  
Modulation: OQPSK  
Integral Antenna gain: A-variant: 1 dBi  
External Antenna gain: N-variant: 2.14 dBi

## Power Supply

Operating voltage range: 2.0 - 3.8 VDC

Separate AC/DC adaptor, Huawei model: HW-050100E01 (115 V, 60 Hz input / 5 V output) was used during the tests to power up the development board which feeds the module (EUT) during AC emissions test. Supply is not provided by the manufacturer. In other tests, the development board/module was supplied with laboratory power supply.

- MGM13S12N, MGM13S02N: tested with 3.3V regulated by the development board
- MGM13S12A: tested with 3.3V powered by laboratory power supply

## Mechanical Size of the EUT

Height: 2 mm

Width: 20 mm

Length: 15 mm

### EUT Test Conditions during Testing

The EUT was in continuous transmit mode during all the tests. EUT was configured into the wanted channel using software provided by the manufacturer.

During conducted measurements, the EUT was connected to WSTK development board.

During radiated measurements, N variant was connected to WSTK development board and the A variant was tested without development board.

Following channels and settings were used during the tests;

**RSS-247 5.4(d)**

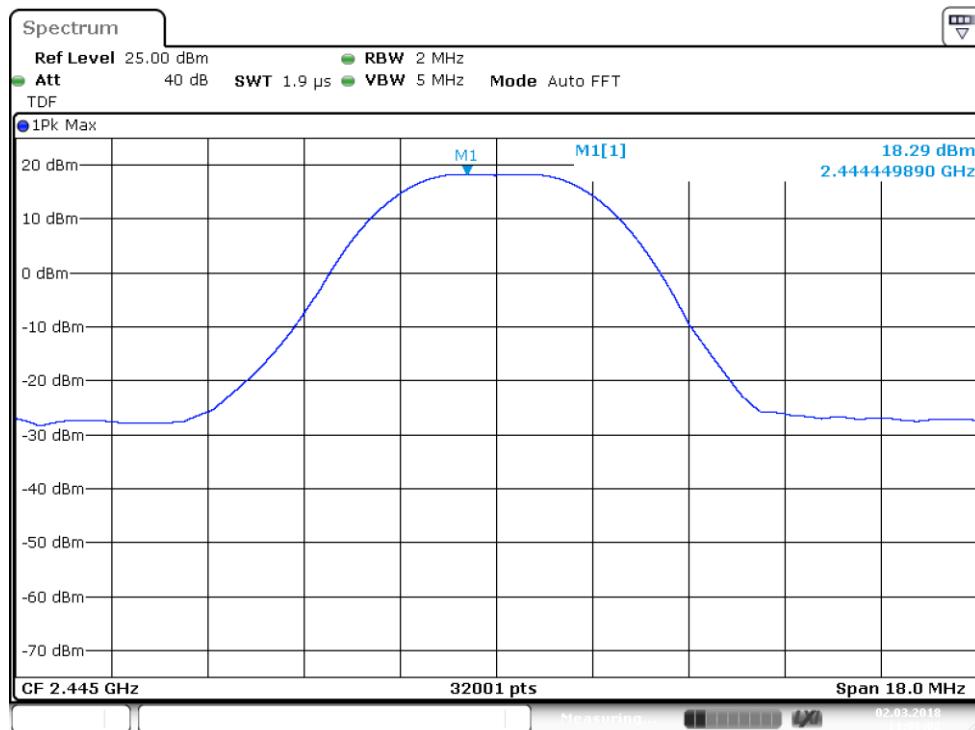

For systems using digital modulation in the 2400-2483.5 MHz bands the limit is 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power.

Measured values are peak values.

**FCC Rule: 15.247(d), 15.209(a)****RSS-247 5.5**

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a).

The correction factor in the final result table contains the sum of the transducers (antenna + amplifier + cables).

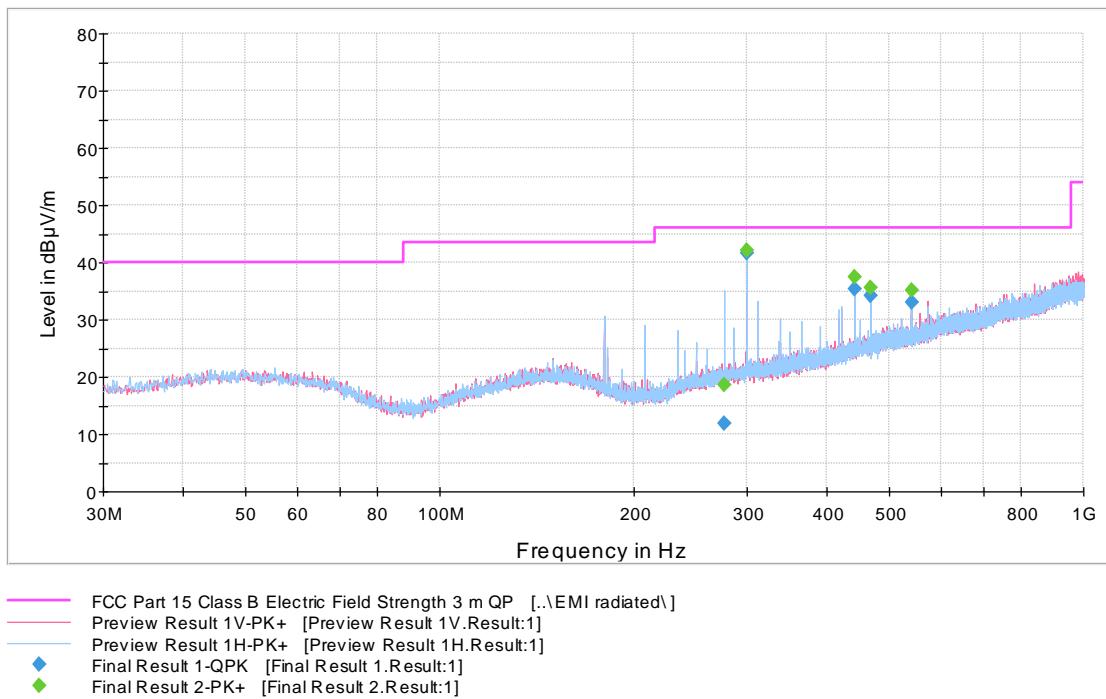

Peak values of emissions below 1000 MHz measured for reference as well as transmitter fundamental.

Measurements were performed for both antenna variants.

**FCC Rule: 15.247(d), 15.209(a)****RSS-247 5.5**

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in Section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).
