MANUFACTURER:

Nokia Corporation

CLIENT: ADDRESS: **TELEPHONE:** **Nokia Corporation** Joensuunkatu 7 H, FIN-24100 SALO, Finland +358 400 815 340, Timo Seppälä

TEST LABORATORY: FCC REG. NO. IC FILE NO.

Nemko Oy 91087 August 24, 2004 IC 4627 July 2, 2003

SUMMARY:

In regard to the performed tests the equipment under test fulfils the requirements defined in the test specifications, see page 2 for details

The test results are valid for the tested unit only. Without a written permission of Nemko Oy it is allowed to copy this report as a whole, but not partially

Nemko Oy • P.O.Box 19, FIN-02601 Espoo, Finland Street address: Perkkaantie 11, FIN-02600 Espoo Telephone +358 (0)424 5454 1 • Telefax +358 (0)9 5489 6371

Summary of performed tests and test results

Section in CFR 47	Section in ICES-003		Result
15.107, a	5.3	AC power line conducted emissions	PASS
15.109, a	5.5	Radiated emissions	PASS

Explanations:

PASS	The EUT passed that particular test.
- A 11	

FAIL The EUT failed that particular test.

1. EUT and Accessory Information

1.1 EUT description

The EUT is a triple band (900/1800/1900MHz) E-GPRS GSM mobile phone with Bluetooth. The highest internal frequency of the EUT was 3819.6 MHz.

1.2 EUT and accessories

	unit	type	S/N

2. Standards and measurement methods

The test were performed in guidance of the CFR 47 Part 15, Subpart B, Class B, ICES-003 Issue 4, ANSI C63.4 and EN 55022.

3. Test results

3.1 AC power line conducted emissions

The test was performed as a compliance test. The test parameters concerned were as follows:

Site name	Nemko Oy/ Perkkaa
Date of testing	30.09.2004
Test equipment	5, 168, 348, 343, 184, 401, 371
Test conditions	22 °C, 35 % RH
Test result	PASS

3.1.1 Test method and limit

The test was performed inside a shielded room where the floor and one of the walls of the test site comprised the reference ground plane (RGP). For the duration of the test the EUT was placed on a non-conductive table 0.8 m high standing on the reference ground plane (see photograph 1). The power input cable of the EUT was connected to an artificial mains network. The test was performed separately on the phase and also on the neutral wire.

The disturbances were first examined by performing a spectrum scan by using a peak detector. The general procedure in the conducted disturbance emission test is that no further measurements are necessary if the disturbance levels measured by using the peak detector are below the limit value defined for the measurement performed by using an average detector.

If not, then at the test frequencies concerned the measurement is performed also by using a quasipeak detector. If the disturbance levels measured by using the quasi-peak detector are below the limit value defined for the measurement performed by using an average detector, then measurements by using the average detector are not necessary.

Frequency band	Quasi-peak limit	Average limit
0.15 – 0.5	66 - 56	<u>56 – 46</u>
0.5 – 5	56	46
5 - 30	60	50

3.1.2 EUT operation mode

EUT operation mode	GSM 1900 Idle
EUT operation voltage	115 V / 60 Hz

3.1.3 EUT test setup

3.2 Radiated emissions

Site name	Nemko / Perkkaa
Date of testing	28.09.2004
Test equipment	350, 338, 42, 543, 544, 319, 525, 401, 184
Test conditions	22 °C, 35 % RH
Test result	PASS

3.2.1 Test method and limit

The test was performed in a semi-anechoic shielded room. The EUT was placed on a non-conductive 0.8 m high table standing on the turntable (photograph 2). During the test in the frequency range 30-8000 MHz the distance from the EUT to the measuring antenna was 3 m. The excess length of the cables of the EUT were made into bundles 30-40 cm in length. In order to find the maximum levels of the disturbance radiation the angle of the turntable, the height of the measuring antenna and the layout of the EUT cables were varied during the tests. The test was performed with the measuring antenna being both in horizontal and vertical polarizations.

Vertical and horizontal polarizations in the frequency range 30 - 1000 MHz were measured by using the peak detector. During the peak detector scan the turntable was rotated from 0° to 360° with 30° step with the antenna heights 1.0 m and 3.0 m. The highest levels of the radiated interference field strength measured by using the quasi-peak detector were recorded.

Vertical and horizontal polarizations in the frequency range 1000 - 8000 MHz was measured by using the peak detector. During the measurement the turntable was rotated from 0° to 360° and the antenna was raised from 1.0 m and 4.0 m.

The CFR 47 Part 15, Subpart B, Class B limit of 500 μ V/m has been calculated to correspond 54 dB(μ V/m) as follows: [dB(μ V/m)]=20log[μ V/m].

Frequency band	Quasi-peak limit
MHz	dB(µV/m)
30 - 230	40
230 - 1000	47

EN 55022 Class B limit (3m measuring distance)

Class B limit (3m measuring distance)

Frequency band	Average limit	Peak limit
MHz	dB(µV/m)	dB(µV/m)
1000 - 8000	54	74

3.2.2 EUT operation mode

EUT operation mode	GSM 1900 Idle
EUT operation voltage	115 V / 60 Hz

3.2.3 EUT test setup

Photograph 2. Radiated emissions test setup

3.2.4 Test data

The measurement results were obtained as described below.

$E UV/M = U_{RX} + A_{CABIF} + AF - G_{PRFA}$	= U _{RX} + A _{CABLE} + AF - G _{PREAM}	$[\mu V/m] = 0$	E
---	--	-----------------	---

Where

U _{RX}	receiver reading
A _{CABLE}	attenuation of the cable
AF	antenna factor
G _{PREAMP}	gain of the preamplifier

Highest emissions:							
Frequency MHz	Level dBµV/m	Transd dB	Limit dBµV/m	Margin dB	Height cm	Azimuth deg	Polarisation
