1.2 COMPLIANCE DESCRIPTION FOR BLUETOOTH TRANSMITTER

This Bluetooth module was built by TI WL1271 chip, it supports Bluetooth v2.1 + Enhanced Data Rate(EDR), it has been tested by a Bluetooth Qualification Lab, it compliance the 15.247 requirements for Bluetooth transmitter, and we confirm the following:

a) Pseudorandom Frequency Hopping Sequence

This system is hopping pseudo-randomly, and its carrier is modulated with the coded information. According to the test plots in section 4 “channel separation” and section 5 “minimum hopping channels”, the frequency of the carrier changes at fixed intervals under the direction of a pseudo-randomly coded sequence, and it has 79 hopping frequencies, for example, the hopping sequence channels can be {20, 12, 28, 04, 52, 44, 60, 36, 76, 05, 13, 68, 29, 37, 45, 21, 69, 73, 77, 65, 22, 28, 30, 20, 46, 58, 62, 42, 78, 13, 15, 76} in one period.

b) Equal Hopping Frequency Use

Each frequency is used equally on the average by each transmitter, from the test result about minimum hopping channels, the each new transmission event begins on the next channel in the hopping sequence after the final channel used in the previous transmission event.

c) System Receiver Input Bandwidth

The receiver input bandwidths that match the hopping channel bandwidths of their corresponding transmitters, and the receiver shifts frequencies in synchronization with the transmitted signals.

1.3 TEST MODE

Unilab has verified the construction and function in typical operation. All the test modes were carried out with the EUT in normal operation, which was shown in this test report and defined as:

2. For radiated emission test, every axis (X, Y, Z) was verified, and show the worst result on this report.

2. TEST METHODOLOGY

The tests documented in this report were performed in accordance with ANSI C63.4 and FCC CFR 47 2.1046, 2.1047, 2.1049, 2.1051, 2.1053, 2.1055, 2.1057, 15.207, 15.209 and 15.247.

2.1 EUT CONFIGURATION

The EUT configuration for testing is installed on RF field strength measurement to meet the Commissions requirement and operating in a manner that intends to maximize its emission characteristics in a continuous normal application

2.2 EUT EXERCISE

The EUT was operated in the engineering mode to fix the TX frequency that was for the purpose of the measurements. According to its specifications, the EUT must comply with the requirements of the Section 15.207, 15.209 and 15.247 under the FCC Rules Part 15 Subpart C.

2.3 GENERAL TEST PROCEDURES

Conducted Emissions

The EUT is placed on the turntable, which is 0.8 m above ground plane. According to the requirements in Section 13.3 of ANSI C63.4: 2009 Conducted emissions from the EUT measured in the frequency range between 0.15 MHz and 30MHz using CISPR Quasi-peak and average detector modes.

Radiated Emissions

The EUT is placed on a turn table, which is 0.8 m above ground plane. The turntable shall rotate 360 degrees to determine the position of maximum emission level. EUT is set 3m away from the receiving antenna, which varied from 1m to 4m to find out the highest emission. And also, each emission was to be maximized by changing the polarization of receiving antenna both horizontal and vertical. In order to find out the maximum emissions, exploratory radiated emission measurements were made according to the requirements in Section 13.4 of ANSI C63.4: 2009.

10. BAND EDGE MEASUREMENT

10.1 TEST SETUP

10.2 LIMITS

According to §15.247(c), in any 100 kHz bandwidth outside the frequency bands in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20dB below that in the 100kHz bandwidth within the band that contains the highest level of the desired power. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a).

10.3 TEST PROCEDURE

The EUT is placed on a turntable, which is 0.8m above the ground plane.

The turntable shall be rotated for 360 degrees to determine the position of maximum emission level.

EUT is set 3m away from the receiving antenna, which is varied from 1m to 4m to find out the highest emission.

Set the spectrum analyzer in the following setting in order to capture the lower and upper band-edges of the emission:

PEAK: RBW=VBW=1MHz / Sweep=AUTO

AVERAGE: RBW=1MHz / VBW=10Hz / Sweep=AUTO

Repeat the procedures until all the PEAK and AVERAGE versus POLARIZATION are measured.
