### 9.1 Test setup

A set of LP/HP/BS filters was used to prevent overloading the spectrum analyzer. The BS simulator was used to set the TX channel and power level and modulate the TX signal with different bit patterns. The test was done using an automated test system, where the measurement devices were controlled by a computer.

### 9.2 Test method

- The emissions were searched and maximized by moving the turn table and measuring antenna and manipulating the EUT.
- All suspicious frequencies with emission levels were recorded.
- The EUT was replaced with a substituting antenna.
- For each frequency recorded, the substituting antenna was fed with the power (from signal generator) giving the same reading as in (b). These power levels were reported.

### 9.3 EUT operation mode

EUT operation mode	GSM, TX on, 1 time slot, PRBS 2E9-1 modulation data EGPRS, TX on, 1 time slot, PRBS 2E9-1 modulation data
EUT channel	661
EUT TX power level	Maximum

### 9.4 Limit

Frequency [MHz]	Level [dBm]
30 – 19100	-13

### 9.5 Results

The formula below was used to calculate the EIRP of the spurious emissions. If there were no emissions closer than 20dB below the limit line, then the emission levels were measured at the transmitter's harmonics.

$$P_{Emission[dBm]} = P_{SubstTX[dBm]} - L_{Cable[dB]} + G_{Antenna[dBi]}$$

where the variables are as follows:

$P_{Measured}$ [dBm]	Measured emission level (from step b in 9.2)
$P_{Subst\_TX}$ [dBm]	Signal generator power (from step d in 9.2) fed to the substituting antenna
$L_{Cable}$ [dB]	Loss of the cable between antenna and signal generator (from step d in 9.2)
$G_{Antenna}$ [dBi]	Gain of the substitutive antenna over isotropic radiator
