AB-ACCESS Access Point (AP)
To: F.C.C. Part 15 Subpart E: 1998

1. Client Information

Company Name:	Adaptive Broadband Ltd
Address:	First Floor, Block C1 The Westbrook Centre Milton Road Cambridge CB4 1YQ Tel: +44-1223-713713 Fax: +44-1223-713714
Contact Name:	Mr P. Simpson Tel: +44-1223-713412 E-Mail: ps@adaptivebroadband.com

Test Of: Adaptive Broadband Ltd
AB-ACCESS Access Point (AP)
To: F.C.C. Part 15 Subpart E: 1998

2. Equipment Under Test (EUT)

The following information (with the exception of the Date of Receipt) has been supplied by the client:

2.1. Identification Of Equipment Under Test (EUT)

Brand Name:	AB-ACCESS
Model Name or Number:	Access Point (AB)
Unique Type Identification:	UNII Pilot
Serial Number:	Pre-Production 001
Country of Manufacture:	UK
FCC ID Number:	Awaiting Certification from the FCC
Date of Receipt:	20 April 1999

Brand Name:	AB-ACCESS
Model Name or Number:	SU and AP 'Wall-Box'
Unique Type Identification:	RJ45
Serial Number:	Pre-Production 001
Country of Manufacture:	UK
FCC ID Number:	Awaiting Certification from the FCC
Date of Receipt:	20 April 1999

Brand Name:	Sinpro Electronic co. Ltd
Description	DC Power Supply Unit
Model Name or Number:	SPU50-9
Unique Type Identification:	None stated by client
Serial Number:	120663
Country of Manufacture:	Taiwan
FCC ID Number:	Awaiting Certification from the FCC
Date of Receipt:	20 April 1999

2.2. Description Of EUT

AB-ACCESS is targeted at providing high-speed wireless internet access in the recently assigned FCC U-NII bands between 5GHz and 6GHz. AB-ACCESS adopts a cellular structure consisting of base stations (Access Point [AP]) servicing many users. It is a fixed access, point to multipoint infrastructure. The product is targeted at the US market only.

The AP is routed via a 'wall box' to the network service provider's trunked infrastructure. The AP has an integral antenna with a 60 degree 3dB beam width to illuminate the desired coverage area. AP units can be installed around the periphery of a tall building or on a tower for optimum coverage. Power and data (bi-directional) are routed via braid and foil screened, quad twisted pair, CAT 5 data cable from an internally mounted wall box (similar in construction to a standard BT telephone outlet) up to the AP antenna unit. Power and data status is also routed via this cable. Power is provided to the wall box via a standard FCC approved 48V DC supply. The wall box provides ATM connectivity via the RJ45 socket to the service providers network.

2.3. Modifications Incorporated In EUT

The EUT has been modified so that it can be driven from a PC test script enabling worst case conditions for FCC requirements to be evaluated and tested for compliance. This modification is purely a software driver. AB-ACCESS employs a rapid TDD (Time Divisions Duplex) air interface based on ATM (Asynchronous Transfer Mode) networking protocols - data is transmitted asynchronously on demand and as such there is no discernible duty from which 'averaged' measurements can be taken. The following test modes have been implemented:

Continuous Transmit – this enables worst case EIRP and PSD to be measured, the unit is set for maximum transmit power.

Continuous Receive – There may be some fundamental frequency components that exceed the switch receive test-mode, again the unit is set to maximum receive gain.

Burst Receive - to measure worst radiated and conducted EMC in receive mode. A predetermined duty cycle will be used, the unit is set for maximum receive gain.

Maximum Transmit Power – this is worst case for switching transients creating spurious emissions – EMC radiated and conducted. As above, a predetermined duty cycle will be used, as before the unit is set for maximum transmits power.

Within each of these modes we can change the operating channel as desired by means of the PC controller.

Test Of: Adaptive Broadband Ltd
AB-ACCESS Access Point (AP)
To: F.C.C. Part 15 Subpart E: 1998

2.4. Additional Information Related To Testing

Power Supply Requirement:	115 V, 60 Hz AC Mains to PSU 48 VDC from PSU to EUT
Current Rating	830mA
Intended Operating Environment:	AP antenna units are mounted outside, operational range is -20 to +50 degrees Celsius. "Wall-box" units and PSUs are mounted internally to users buildings/office/home.
Weight:	AP antenna unit 5 Kg max
Dimensions:	AP = 500mm (h) x 250mm (w) x 80mm (d)
Interface Ports:	'Wall-box' RJ45 socket – Ethernet / ATM available
Type of Device	Fixed Access Wireless Internet System
Antenna Details	Permanently Attached
Occupied Bandwidth	17 MHz
Type of Modulation	QPSK at 25Mbps/sec, raised cosine filter ($\alpha = 0.35$)
Number of Tx Channels	15 Channels of 15 MHz, 5 channels in each U-NII Band
Method of Frequency Generation	Synthesiser
Category of Receiver	Superheterodyne

Test Of: Adaptive Broadband Ltd
AB-ACCESS Access Point (AP)
To: F.C.C. Part 15 Subpart E: 1998

2.5. Support Equipment

The following support equipment was used to exercise the EUT during testing:

Description:	PC
Brand Name:	Dell
Model Name or Number:	Latitude
Serial Number:	DP/N0009321C – 12800 – 8BM2910 – ZL6D8
FCC ID Number:	None stated by client
Cable Length And Type:	6m Ethernet UTP
Connected to Port:	Wall-Box (Configuration Only)

Description:	PSU for PC
Brand Name:	Dell
Model Name or Number:	PA-2
Serial Number:	DP/N 0085391 REV A01
FCC ID Number:	None stated by client
Cable Length And Type:	1m DC
Connected to Port:	PC Input

Description	ATM Switch
Brand Name:	ATML
Model Name or Number:	VIRATA Switch 1000
Serial Number:	VM1000-01-1001664
FCC ID Number:	None Stated by Client
Cable Length And Type:	6m Ethernet UTP
Connected to Port:	Wall-Box

3. Test Specification, Methods And Procedures

3.1. Test Specification

Reference:	FCC Part 15 Subpart E: 1998
Title:	Code of Federal Regulations, Part 15 (47CFR15) Radio Frequency Devices: Digital Devices. Subpart E: Unlicensed National Information Infrastructure Devices
Comments:	A description of the test facility used for this test is on file with, and has been accepted by, the Federal Communications Commission as required by Section 2.948 of Federal Rules.
Purpose of Test:	To determine whether the equipment complied with the requirements of the specification for the purposes of certification.

3.2. Methods And Procedures

The methods and procedures used were as detailed in:

ANSI C63.2 (1987)

Title: American National Standard for Instrumentation - Electromagnetic noise and field strength.

ANSI C63.4 (1992)

Title: American National Standard Methods of Measurement of Electromagnetic Emissions from Low Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz.

ANSI C63.5 (1988)

Title: American National Standard for the Calibration of antennas used for Radiated Emission measurements in Electromagnetic Interference (EMI) control.

ANSI C63.7 (1988)

Title: American National Standard Guide for Construction of Open Area Test Sites for performing Radiated Emission Measurements.

CISPR 16 (1987)

Title: Specification for Radio Interference measuring apparatus and measurement methods.

3.3. Definition Of Measurement Equipment

The measurement equipment used complied with the requirements of the standards referenced in the Methods & Procedures section above. Appendix 1 contains a list of the test equipment used.

RADIO FREQUENCY INVESTIGATION LTD.

EMC Department

Test Of: Adaptive Broadband Ltd

TEST REPORT

S.No: RFI/EMCB2/RP38797A

Page 10 of 56

Issue Date: 19 December 2000

4. Deviations From The Test Specification

None

5. Operation Of The EUT During Testing

5.1. Operating Conditions

The EUT was tested in a normal laboratory environment.

During testing, the EUT was powered by a 48 V DC Supply from the PSU. The PSU was powered from a 115 V, 60 Hz AC Mains supply.

5.2. Operating Modes

The EUT was tested in the following operating mode:

Continuous and Maximum Transmit Power for transmitter tests to FCC Part 15 Subpart E (15.407).

Continuous and bursted receive for receiver tests to FCC Part 15 Subpart B.

For both transmit and receive modes, tests were performed with the EUT set to the following channels for each of the 3 operating bands.

Bottom Band: 5.15 to 5.25 GHz:	Bottom Channel (Channel 0)	5.17 GHz
	Top Channel (Channel 4)	5.23 GHz
Middle Band: 5.25 to 5.35 GHz:	Bottom Channel (Channel 5)	5.27 GHz
	Top Channel (Channel 9)	5.33 GHz
Top Band: 5.725 to 5.825 GHz:	Bottom Channel (Channel 10)	5.745 GHz
	Top Channel (Channel 14)	5.805 GHz

The reason for choosing this mode was that it was defined by the client as being likely to be the worst case with regards EMC.

5.3. Configuration And Peripherals

The EUT was tested in the following configuration: The AP antenna unit is connected via S-FTP-Cat5 cable to the wall-box. The power was supplied from the PSU to the wall-box. Data was controlled from the support PC to the wall-box via UTP-Cat5 Ethernet cables.

The reason for choosing this configuration was that it was defined by the client as being likely to be the worst case with regards EMC and typical of an installation at a users home / office.

NB Section 2 of this report contains a full list of support equipment used and Appendix 3 contains a schematic diagram of the test configuration.

Test Of: Adaptive Broadband Ltd
AB-ACCESS Access Point (AP)
To: F.C.C. Part 15 Subpart E: 1998

6. Summary Of Test Results

6.1. Transmitter Tests

Range Of Measurements	Specification Reference	Compliance Status
AC Powerline Conducted Emissions, 450 kHz to 30 MHz	Section 15.407 (b5) of C.F.R. 47: 1998. (Section 15.207)	Complied
Effective Isotropic Radiated Power Levels, 5 GHz to 6 GHz	Section 15.407 (a) of C.F.R. 47: 1998.	Complied
Electric Field Strength Spurious Emissions, 30 MHz to 1000 MHz	Section 15.407 (b5) of C.F.R. 47: 1998 (Section 15.209)	Complied
Effective Isotropic Radiated Power Spurious Emissions, 1 GHz to 40 GHz	Section 15.407 (b1/2/3) of C.F.R. 47: 1998.	Complied
Frequency Stability -20°C to +50°C 85% to 115% VAC @ 20°C	Section 15.407 (g) of C.F.R. 47: 1997	Complied

6.2. Receiver Tests

Range Of Measurements	Specification Reference	Compliance Status
AC Powerline Conducted Emissions, 450 kHz to 30 MHz	Section 15.107 Class B of C.F.R. 47: 1998.	Complied
Electric Field Strength Spurious Emissions, 30 MHz to 26000 MHz	Section 15.109 Class B of C.F.R. 47: 1998	Complied

6.3. Location Of Tests

All the measurements described in this report were performed at the premises of Radio Frequency Investigation Ltd, Ewhurst Park, Ramsdell, Basingstoke, Hampshire, RG26 5RQ, England.

7. Measurements, Examinations And Derived Results

7.1. General Comments

7.1.1. This section contains test results only. Details of the test methods and procedures can be found in Appendix 2 of this report.

7.1.2. The measurement uncertainties stated were calculated in accordance with the requirements of NAMAS Document NIS 81 with a confidence level of 95%. Please refer to Section 8 for details of measurement uncertainties.

7.2. Test Results For AC Mains Conducted Emissions: Tx and Rx Mode

7.2.1. Quasi-Peak Detector Measurements On Live And Neutral Lines

7.2.1.1. Measurements were performed to FCC Part 15.107 Class B (Unintentional Radiators) and FCC Part 15.207 (Intentional Radiators).

7.2.1.2. The EUT was operated simultaneously in both maximum transmit power and burst receive mode on the specified channel.

7.2.1.3. Plots of the initial scans can be found in Appendix 4.

7.2.1.4. Preliminary conducted spurious emission scans were performed with the EUT set to all 6 channels stated in section 5.2. These preliminary scans showed similar emission levels for each of the channels. Therefore final conducted emission measurements were performed with the EUT set to Bottom Band Bottom Channel (Channel 0).

7.2.1.5. The following table lists frequencies at which emissions were measured using a Quasi-Peak detector:

Bottom Band Bottom Channel (Channel 0)

Frequency (MHz)	Line	Q-P Level (dBmV)	Q-P Limit (dBmV)	Margin (dB)	Result
0.563	Live	35.5	48.0	12.5	Complied
0.563	Neutral	37.3	48.0	10.3	Complied
3.101	Live	43.9	48.0	4.1	Complied
3.101	Neutral	44.8	48.0	3.2	Complied
3.288	Live	45.4	48.0	2.6	Complied
3.288	Neutral	46.2	48.0	1.8	Complied
10.306	Live	33.7	48.0	14.3	Complied
10.306	Neutral	33.5	48.0	14.5	Complied
13.671	Live	38.5	48.0	9.5	Complied
13.671	Neutral	36.8	48.0	11.2	Complied
18.000	Live	36.5	48.0	11.5	Complied
18.000	Neutral	37.2	48.0	10.8	Complied

Test Of: Adaptive Broadband Ltd
 AB-ACCESS Access Point (AP)
 To: F.C.C. Part 15 Subpart E: 1998

7.2.2. Test Results For AC Mains Conducted Emissions: Tx and Rx Mode (continued)

7.2.2.1. Further to section 7.2.1, additional measurements were performed on frequencies within 6dB of the limit with the EUT set to each of the other 5 operating channels.

Bottom Band Top Channel (Channel 4)

Frequency (MHz)	Line	Q-P Level (dBmV)	Q-P Limit (dBmV)	Margin (dB)	Result
3.101	Live	44.5	48.0	3.5	Complied
3.101	Neutral	45.0	48.0	3.0	Complied
3.288	Live	45.3	48.0	2.7	Complied
3.288	Neutral	46.3	48.0	1.7	Complied

Middle Band Bottom Channel (Channel 5)

Frequency (MHz)	Line	Q-P Level (dBmV)	Q-P Limit (dBmV)	Margin (dB)	Result
3.101	Live	44.5	48.0	3.5	Complied
3.101	Neutral	44.9	48.0	3.1	Complied
3.288	Live	45.3	48.0	2.7	Complied
3.288	Neutral	46.3	48.0	1.7	Complied

Middle Band Top Channel (Channel 9)

Frequency (MHz)	Line	Q-P Level (dBmV)	Q-P Limit (dBmV)	Margin (dB)	Result
3.101	Live	44.8	48.0	3.2	Complied
3.101	Neutral	45.1	48.0	2.9	Complied
3.288	Live	45.4	48.0	2.6	Complied
3.288	Neutral	46.3	48.0	1.7	Complied

Test Of: Adaptive Broadband Ltd
AB-ACCESS Access Point (AP)
To: F.C.C. Part 15 Subpart E: 1998

7.2.3. Test Results For AC Mains Conducted Emissions: Receive Mode (continued)**Top Band Bottom Channel (Channel 10)**

Frequency (MHz)	Line	Q-P Level (dBmV)	Q-P Limit (dBmV)	Margin (dB)	Result
3.101	Live	44.9	48.0	3.1	Complied
3.101	Neutral	45.2	48.0	2.8	Complied
3.288	Live	45.4	48.0	2.6	Complied
3.288	Neutral	46.3	48.0	1.7	Complied

Top Band Top Channel (Channel 14)

3.288	Neutral	46.5	48.0	1.5	Complied

Test Of: Adaptive Broadband Ltd
 AB-ACCESS Access Point (AP)
 To: F.C.C. Part 15 Subpart E: 1998

7.3. Test Results For Radiated Emissions: Tx and Rx Mode

7.3.1. Electric Field Strength Measurements: 30 MHz to 1000 MHz

7.3.1.1. Measurements were performed to FCC Part 15.109 Class B (Unintentional Radiators) and FCC Part 15.209 (Intentional Radiators).

7.3.1.2. The EUT was operated simultaneously in both maximum transmit power and burst receive mode on the specified channel.

7.3.1.3. The client has stated that the highest clock frequency for the EUT was 4.9025 GHz. Therefore tests were performed up to 26.0 GHz.

7.3.1.4. Preliminary radiated spurious emission scans were performed with the EUT set to all 6 channels stated in section 5.2. These preliminary scans showed similar emission levels for each of the channels. Therefore final radiated emission measurements were performed with the EUT set to Bottom Band Bottom Channel (Channel 0).

7.3.1.5. Plots of the initial scans can be found in Appendix 4.

7.3.1.6. The following table lists frequencies at which emissions were measured using a Quasi-Peak detector at a test distance of 3m (results incorporate antenna factors and cable losses):

Middle Band Top Channel (Channel 9)

Frequency (MHz)	Ant. Pol.	Q-P Level (dBmV/m)	Q-P Limit (dBmV/m)	Margin (dB)	Result

Test Of: Adaptive Broadband Ltd
AB-ACCESS Access Point (AP)
To: F.C.C. Part 15 Subpart E: 1998

7.4. Test Results For Radiated Emissions: Receive Mode

7.4.1. Electric Field Strength Measurements: 1 GHz to 26 GHz

7.4.1.1. Measurements were performed to FCC Part 15.109 Class B (Unintentional Radiators).

7.4.1.2. The client has stated that the highest clock frequency for the EUT was 4.9025 GHz. Therefore tests were performed up to 26.0 GHz.

7.4.1.3. Preliminary radiated spurious emission scans were performed with the EUT set to all 6 channels stated in section 5.2. Final radiated emission measurements were performed only if the preliminary scan showed any spurious emissions to be within 10dB of the reference limit line.

7.4.1.4. At higher frequencies, due to the limitations of the dynamic range of the measuring receiver it was not possible to perform radiated emission preliminary scans and final measurements at the specified 3m test distance. Therefore the measuring antenna was moved to a test distance of 1m. The limit was extrapolated using the factor $20 \log (d1/d2)$.

7.4.1.5. Plots of the initial scans can be found in Appendix 4.

7.4.1.6. The following tables list frequencies at which emissions were measured using Average and Peak detector functions at a test distance of 1m:

Bottom Band Bottom Channel (Channel 0)

Frequency (GHz)	Antenna Polarity (H/V)	Average Detector level (dBmV)	Antenna factor (dB)	Cable loss (dB)	Actual Average Level (dBmV/m)	Average Limit (dBmV/m)	Average Margin (dB)	Result

7.5. Test Results For Radiated Emissions: Transmit Mode

7.5.1. Effective Isotropic Radiated Power Measurements: 5.0 GHz to 6.0 GHz.

7.5.1.1. Measurements were performed to FCC Part 15.407(a) (Unlicensed National Information Infrastructure Devices).

7.5.1.2. The client has stated that the EUT operated in the frequency ranges of 5.15 to 5.25 GHz, 5.25 to 5.35 GHz, and 5.725 to 5.825 GHz. Measurements were performed at both bottom and top channels within each band.

7.5.1.3. The EUT was configured with a permanently connected antenna. The client has stated that the directional gain of the antenna is 18dBi. EIRP measurements were performed to determine the output power levels of the EUT, and the limit was increased by 6dB to compensate for the antenna being connected. The specified limit includes the 6dB antenna gain.

7.5.1.4. It was possible to polarise the antenna incorporated within the EUT for both vertical and horizontal polarisation's. Therefore EIRP measurements were performed with the antenna polarised in both planes.

7.5.1.5. Results are shown for the EUT operating on each of the 6 channels stated in section 5.2. Measurements are shown for both transmit power levels and peak power spectral density. Plots showing the characteristics of the transmitter output can be seen in Appendix 4.

7.5.1.6. In addition to the measurements stated in section 7.10.1.5, additional results were calculated for the ratio of the peak excursion of the modulation envelope as stated in FCC Part 15.407(a[6]).

7.6. Test Results For Radiated Emissions: Transmit Mode

7.6.1. Effective Isotropic Radiated Power Spurious Measurements: 1.0 GHz to 40.0 GHz.

7.6.1.1. Measurements were performed to FCC Part 15.407(b) (Unlicensed National Information Infrastructure Devices).

7.6.1.2. The client has stated that the highest clock frequency for the EUT was 5.825 GHz. Therefore tests were performed up to 40.0 GHz.

7.6.1.3. Preliminary EIRP scans were performed with the EUT operating on each of the 6 channels stated in section 5.2. Plots showing the spurious (undesirable) emission levels can be seen in Appendix 4.

7.6.1.4. The EUT was configured with a permanently connected antenna. It was possible to polarise the antenna for both vertical and horizontal polarisation's. Therefore EIRP measurements were performed with the antenna polarised in both planes.

Results:

7.6.1.5. Preliminary scans were performed with the EUT operated on each of the 6 channels stated in section 5.2. It can be shown from the plots (Plots 087 to 134) that all emissions outside of the transmitter band edges are of at least 6dB from the reference limit line. Therefore no final measurements were performed.

7.6.1.6. All preliminary scans (Plots 087 to 134) can be seen in Appendix 4.

Test Of: Adaptive Broadband Ltd
 AB-ACCESS Access Point (AP)
 To: F.C.C. Part 15 Subpart E: 1998

7.7. Test Results For Frequency Stability: Transmit Mode

7.7.1. Measurements for frequency stability were performed in accordance with FCC Part 15.407 (g) of C.F.R. 47:1997.

7.7.2. Measurements were performed over the temperature range of -20°C to +50°C at the nominal operating voltage, and over an operating voltage of 85% to 115% at +20°C.

7.7.3. The client has specified that due to the transmission of broadband data centred around the nominal carrier frequency of the EUT, measurements of any 'drift' are virtually impossible. However valid measurements would be possible by observing the drift on the main local oscillator, which is 902.5 MHz below the nominal centre frequency. All oscillators within the EUT are referenced to a single source and so any drift can be easily quantified. Also due to the integrated nature of the antenna, and its associated gain/frequency response, any 'drift' can be observed whilst operating at the top frequency of the U-NII band (Channel 14).

7.7.4. Measurements for frequency drift were performed with the EUT operating on Channel 14. A plot (Plot 169) of the frequency stability was performed, with the EUT supply voltage, varied from 85% to 110%, and then up to 115%. At all times the ambient temperature was maintained at +20°C. A further plot (Plot 170) was performed to show the frequency stability of the EUT, with the ambient temperature varied from -20°C to +20°C, and then to +50°C. The supply voltage to the EUT remained at a constant 115V. The plots of both measurements can be seen in Appendix 4.

Results: Supply Variation

Nominal Operating Frequency	Frequency Deviation @ +20°C			Limit (±10ppm)	Result
	85% Supply Voltage	100% Supply Voltage	115% Supply Voltage		
4.90249 GHz	< 1 kHz	< 1 kHz	< 1 kHz	49 kHz	Complied

Results: Temperature Variation

Nominal Operating Frequency	Frequency Deviation @ 115 V			Limit (±10ppm)	Result
	-20°C	+20°C	+50°C		
4.90249 GHz	< 10 kHz	< 1 kHz	< 10 kHz	49 kHz	Complied

8. Measurement Uncertainty

8.1. Company Policy, as based on the NAMAS Accreditation Standard, M10, paragraph 12.11 (o), states that Test Reports shall include estimated uncertainty of the calibration or test result (this information need only appear in test reports and test certificates where it is relevant to the validity or application of the test result, where a client's instructions so require or where uncertainty affects compliance to a specification or limit).

8.2. The global uncertainties have been calculated in accordance with NAMAS NIS 81 (Edition 1, May 1994) as follows:

Measurement Type	Range	Confidence Level	Calculated Uncertainty
Conducted Emissions	0.15 MHz to 30 MHz	95%	+/- 2.2 dB
Radiated Field Strength Emissions	30 MHz to 1000 MHz	95%	+/- 4.9 dB
Radiated Field Strength Emissions	1.0 GHz to 26.0 GHz	95%	+/- 4.0 dB
Effective Isotropic Radiated Power	1.0 GHz to 40.0 GHz	95%	+/- 4.0 dB
Frequency Stability	N/A	95%	+/- 4.2 dB

8.3. Measurement uncertainties have been applied in accordance with NAMAS document NIS 81 (edition 1, May 1994), and in the absence of any specification criteria, guidance, or code of practice, compliance has been judged on the basis of shared risk.

8.4. In the case of emissions tests, the measured value of the disturbance from the product sample shall be compared directly with the limits. If the measured value is equal to or less than the limit the product is deemed to pass the test.

8.5. In the case of immunity tests, the equipment is deemed to pass the test if it fulfils the stated performance criteria at the required or a higher severity level. The measurement uncertainty has been taken into account in the calibration procedures stated in the relevant basic standard.

8.6. The methods used to calculate the above uncertainties are in line with those used for calibration laboratories contained in NAMAS document NIS 3003 Edition 8 "The Expression of Uncertainty and Confidence in Measurement" May 1995, which align with international recommendations "Guide to the Expression of Uncertainty in Measurement" ISO/IEC/OIML/BIPM (Prepared by ISO/TAG 4: January 1993).

Appendix 2. Measurement Methods

A2.1. AC Mains Conducted Emissions: FCC Part 15

A2.1.1. AC mains conducted emissions measurements were performed in accordance with the standard, against appropriate limits for each detector function.

A2.1.2. The test was performed in a shielded enclosure with the equipment arranged as detailed in the standard on a wooden bench using the floor of the screened enclosure as the ground reference plane and with the EUT powered via a 115 V 60 Hz AC mains supply.

A2.1.3. Initial measurements in the form of swept scans covering the entire measurement band were performed in order to identify frequencies on which the EUT was generating interference. In order to minimise the time taken for these swept measurements, a Peak detector was used in conjunction with the appropriate detector IF measuring bandwidths (see table below). Repetitive scans were performed to allow for emissions with low repetition rates, and the duty cycle of the EUT. The test configuration was the same for the initial scans as for the final measurements.

A2.1.4. Following the initial scans, a graph was produced giving an overview of the emissions from the EUT plotted against the appropriate specification limit. A tolerance line was set 6 dB below the specification limit and levels above the tolerance line were re-tested (at individual frequencies) using the appropriate detector function.

A2.1.5. The test equipment settings for conducted emissions measurements were as follows:

Receiver Function	Initial Scan	Final Measurements
Detector Type:	Peak	Quasi-Peak (CISPR)*
Mode:	Max Hold	Not applicable
Bandwidth:	10 kHz	9 kHz
Amplitude Range:	60 dB	20 dB
Measurement Time:	Not applicable	> 1 s
Observation Time:	Not applicable	> 15 s
Step Size:	Continuous sweep	Not applicable
Sweep Time:	Coupled	Not applicable

* In some instances an Average detector function may also have been used.

A2.2. Radiated Field Strength Emissions

A2.2.1. Radiated emissions measurements were performed in accordance with the standard, against appropriate limits for each detector function.

A2.2.2. Initial measurements covering the entire measurement band in the form of swept scans in a shielded enclosure (for frequencies below 4 GHz) or on an open area test site (for frequencies above 4 GHz) were performed in order to identify frequencies on which the EUT was generating interference. This determined the frequencies on which the EUT should be re-measured in full on the open area test site. In order to minimise the time taken for the swept measurements, a Peak detector was used in conjunction with the appropriate detector IF measuring bandwidth (see table below). Repetitive scans were performed to allow for emissions with low repetition rates, and for the duty cycle of the EUT. The test configuration was the same for the initial scans as for the final measurements.

A2.2.3. The initial scans were performed using an antenna height of 1.5 m and a measurement distance of 3 m. Where (at higher frequencies) the noise floor was found to be of a higher level, a test distance of 1m was used. Following the initial scans, graphs were produced giving an overview of the emissions from the EUT plotted against the appropriate specification limit. A tolerance line was set 6 dB below the specification limit and levels above the tolerance line were re-tested on the open area test site, at the appropriate distance, using a measuring receivers with a Quasi-Peak detector (below 1000 MHz), where applicable, for measurements above 1000 MHz average and peak detectors were used.

A2.2.4. For the main (final) measurements the EUT was arranged on a non-conducting table on an open area test site, as detailed in the specification.

A2.2.5. All measurements on the open area test site were performed using broadband antennas.

A2.2.6. On the open area test site, at each frequency where a signal was found, the levels were maximised by initially rotating the turntable through 360°. In addition, for frequencies below 1000 MHz, the antenna height was varied between 1 and 4 m. For frequencies above 1000 MHz, the antenna was fixed at a height of 1.5m. At this point, any signals found to be between the limit and a level 6 dB below it were further maximised by changing the configuration of the EUT, e.g. re-routing cables to peripherals and moving peripherals with respect to the EUT.

AB-ACCESS Access Point (AP)
To: F.C.C. Part 15 Subpart E: 1998

A2.2.7. The test equipment settings for radiated emissions measurements were as follows:

Receiver Function	Initial Scan Below 1GHz	Final Measurements Below 1GHz
Detector Type:	Peak	Quasi-Peak (CISPR)
Mode:	Max Hold	Not applicable
Bandwidth:	120 kHz	120 kHz
Amplitude Range:	60 dB	20 dB
Measurement Time:	Not applicable	> 1 s
Observation Time:	Not applicable	> 15 s
Step Size:	Continuous sweep	Not applicable
Sweep Time:	Coupled	Not applicable

Receiver Function	Initial Scan Above 1GHz	Final Measurements Above 1 GHz
Detector Type:	Peak	Peak/Average
Mode:	Max Hold	Not applicable
Bandwidth:	1 MHz	1 MHz
Amplitude Range:	60 dB	20 dB (typical)
Measurement Time:	Not applicable	> 1 s
Observation Time:	Not applicable	> 15 s
Step Size:	Continuous sweep	Not applicable
Sweep Time:	Coupled	Not applicable

A.2.3.Effective Isotropic Radiated Power Measurements: 5.0 GHz to 6.0 GHz.

A.2.3.1. Effective Isotropic Radiated Power measurements were performed in accordance with the standard, against the appropriate limits on an open area test site.

A.2.3.2. The EUT was set to transmit on the required channel at maximum transmit power. The channels stated in section 5.2 were tested. The EUT was configured with a permanently attached antenna. Therefore radiated power measurements were performed.

A.2.3.3. The EUT was mounted on a non-metallic table at a 1 m test height. The receive (test) antenna was placed at a test distance of 2m. The EUT was set to operate at the required channel and the exact frequency recorded. A substitution measurement was then performed to determine the loss of the test set-up. (Details of the substitution method can be seen in Appendix A.2.6.).

A.2.3.4. The level recorded for the substitution method was entered as a level offset in the measuring receiver. Initial measurements covering the entire measurement band were performed in the form of a swept scan. In order to minimise the time taken for the swept measurements, a Peak detector was used in conjunction with the appropriate detector IF measuring bandwidth (1MHz). Repetitive scans were performed to allow for emissions with low repetition rates, and for the duty cycle of the EUT. The EUT was rotated through 360° to maximise all emissions. The test was performed with the EUT integral antenna set for both horizontal and vertical polarisations. The test antenna was also set for both polarities.

A.2.3.5. The measured Peak Transmit Power and the Power Spectral Density could then be determined.

A.2.3.6. The EUT was set to the next channel and sections A.2.3.2. to A.2.3.5. were repeated.

A.2.4. Effective Isotropic Radiated Power Spurious Measurements: 1.0 GHz to 40.0 GHz.

A.2.4.1. Effective Isotropic Radiated Power Spurious measurements were performed in accordance with the standard, against the appropriate limits on an open area test site.

A.2.4.2. The EUT was set to transmit on the required transmit channel at maximum transmit power. The channels stated in section 5.2 were tested. The EUT was configured with a permanently attached antenna. Therefore radiated power measurements were performed.

A.2.4.3. The EUT was mounted on a non-metallic table at a 1.5m test height. The receive (test) antenna was placed at a test distance of 2m. For each of the frequency ranges performed, a substitution method was performed to determine the worst case loss of the test set-up. (Details of the substitution method can be seen in Appendix A.2.6.)

A.2.4.4. The level recorded for the substitution method was entered as a level offset in the measuring receiver. Initial measurements covering the entire measurement band were performed in the form of a swept scan (For frequencies below 4 GHz, initial scans were performed in a shielded enclosure). In order to minimise the time taken for the swept measurements, a Peak detector was used in conjunction with the appropriate detector IF measuring bandwidth (1MHz). Repetitive scans were performed to allow for emissions with low repetition rates, and for the duty cycle of the EUT. The EUT was rotated through 360° to maximise all emissions. The test was performed with the EUT integral antenna set for both horizontal and vertical polarisation. The test antenna was also set for both polarities.

A.2.4.5. The maximum emission level obtained in dBm/MHz could then be determined. Any levels which were found to be within 6dB of the reference limit line were re-measured with a substitution measurement being performed.

A.2.4.6. The EUT was set to the next channel and sections A.2.4.2. to A.2.4.5. were repeated.

To: F.C.C. Part 15 Subpart E: 1998**

A2.5. Frequency Stability

A.2.5.1. Measurements were performed to determine the frequency stability against the specified limits.

A.2.5.2. An environmental test chamber was used to perform the testing required.

A.2.5.3. The EUT was situated inside the environmental test chamber and the required temperature (starting from the lowest level) was allowed to settle prior to switching on the EUT.

A.2.5.4. The EUT was switched on and the relevant frequency was recorded. The EUT was left switched on and measurements were performed after 2, 5 and 10 minutes.

A2.5.5. Frequency and RF output power measurements were then made at intervals of one minute for a duration of 10 minutes whilst maintaining the required temperature.

A2.5.6. The EUT was then switched off for a minimum of 30 minutes and the environmental chamber was allowed to stabilise at the next temperature. Points A2.5.3. to A2.5.5. were then repeated.

A.2.5.7. The test chamber was then allowed to stabilise at +20°C for a minimum of 30 minutes. The supply voltage was then adjusted on the EUT from 85% to 115% and the frequency recorded.

A.2.6. Substitution Methods

A.2.6.1. The equipment is configured as illustrated in Appendix 4.

A.2.6.2. The EUT is replaced by an in-band antenna connected to a signal generator tuned to the frequency of interest. A 10dB attenuator was connected to improve matching.

A.2.6.3. The transmit and receive antennas were vertically polarised at a fixed height of 1.5 metres.

A.2.6.4. The signal generator level is then adjusted to give a level equal to that obtained from the EUT.

A.2.6.5. The radiated power is given by the formula below.

$$\text{True Signal level} = \text{Signal Generator Level} - \sum L + Ag$$

where:

$\sum L$ is the sum of the losses, i.e. cable loss.

Ag is the isotropic gain of the antenna.

A.2.6.6. The measurement shall be repeated for horizontal polarisation.

Appendix 3. Test Configuration Drawings

This appendix contains the following drawings:
