

RF Exposure evaluation

Product Description: Audio On Plus
Model Number: MOOB-CHGM-000-001
FCC ID: ZL5MOOB

According to 447498 D01 General RF Exposure Guidance v05 The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50 mm are determined by: $[(\text{max. power of channel, including tune-up tolerance, mW})/(\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] \leq 3.0$ for 1-g SAR and ≤ 7.5 for 10-g extremity SAR, where

$f(\text{GHz})$ is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest mW and mm before calculation

According to the test data,
 $P_t=5.83\text{dBm}=0.00383\text{W}=3.83\text{mW}$

The result is rounded to one decimal place for comparison
Worse case is as below: $[2402\text{MHz}-3.83\text{mW output power}]$
 $(3.83\text{mW}/5\text{mm}) \cdot [\sqrt{2.402(\text{GHz})}] = 1.19 < 3.0$ for 1-g SAR
Then SAR evaluation is not required

NOTE: For the maximum power, you can refer FCC test report.
