# **Test Result**

The requirements of the tests performed as shown in the overview (clause 4) were fulfilled by the equipment under test. The complete test results are presented in the following. "Passed" indicates that the equipment under test conforms with the relevant limits of the testing standard without taking any measurement uncertainty into account as stated in clause 1.4 of ANSI C63.10 (2020). However, the measurement uncertainty is calculated and shown in this test report.

Date of receipt of test sample:	05.02.2025
Start of test:	06.02.2025
End of test:	14.02.2025

# 2 **Operational States**

#### **Description of function of the EUT:**

The EUT is a digital torque measurement system working with 10.7 MHz radio communication and 17.5 kHz wireless power transfer.

During all tests the EUT was powered with 24 V DC external power supply and internal via 17.5 kHz WPT.

For the conducted emission test the following AC power adaptor provided by the applicant was used: Phoenix Contact TRIO-PS/1AC/24DC/5 Order.No: 2866310

#### The system was setup as follows:

# **3** Additional Information

The EUT was not labeled as required by FCC / IC.

To fulfill the radiated emission test, the following ferrite chokes as shown in the Annex were used. At the control unit connection cable 2 x Vitroperm 500F Model No.: T60006-L2063-W517 ferrit chokes with 3 turns.

At the supply line of the control unit 2 x Würth snap ferrite 742 716 33 with 1 turn and 1 x Würth snap ferrite 742 711 31 with 2 turns.

# 4 Overview

Application	Frequency range [MHz]	FCC 47 CFR Part 15 section [2]	RSS-Gen, Issue 5 [4] and RSS-210, Issue 11 [3]	Tested EUT	Status
Conducted emissions on supply line	0.15 – 30	15.207 (a)	8.8 [4]	1	Passed
Radiated emissions	0.009 - 1000 **	15.205 (a) 15.209 (a)	8.9 and 8.10 [4] 8.1 and 8.3 [3]	1	Passed
99 % bandwidth	17.5 kHz 10.7 MHz	-	6.7 [4]	1	Passed
Antenna requirement	-	15.203 [2]	6.8 [4]	1	Passed *

\*: Integrated antenna only, requirement fulfilled.

\*\*: As declared by the applicant the highest radio clock frequency is 10.7 MHz. Therefore the radiated emission measurement must be carried out up to 10<sup>th</sup> of the highest radio clock frequency in this case 1 GHz.

# **5** Results

## 5.1 Test setups

## 5.1.1 Radiated: Test fixture

The test is carried out in a shielded chamber. Floor standing devices are set up on a floor and the spectrum analyser is connected to a test fixture / loop antenna, which is placed at the antenna of the EUT.

## 5.1.2 Radiated: 9 kHz to 30 MHz

## 5.1.2.1 Preliminary measurement 9 kHz to 30 MHz

In the first stage a preliminary measurement is performed in a semi-anechoic chamber at a measuring distance of 3 meters. Table-top devices are set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices are placed directly on the turntable / ground plane. The setup of the equipment under test is in accordance with [1].

The frequency range 9 kHz to 30 MHz is monitored with an EMI receiver while the system and its cables are manipulated to find out the configuration with the maximum emission levels if applicable. The EMI receiver is set to MAX hold mode. The EUT and the measuring antenna are rotated around their vertical axis to find the maximum emission levels.

The resolution bandwidth of the EMI receiver is set to the following values:

Frequency range	Resolution bandwidth	
9 kHz to 150 kHz	200 Hz	
150 kHz to 30 MHz	9 kHz	

Procedure preliminary measurement:

Pre-scans are performed in the frequency range 9 kHz to 150 kHz and 150 kHz to 30 MHz. The following procedure is used:

- 1) Monitor the frequency range with the measuring antenna facing the EUT and an EUT / turntable azimuth of 0 °.
- 2) Manipulate the system cables to produce the maximum levels of emissions.
- 3) Rotate the EUT by 360 ° to maximize the detected signals.
- 4) Measure the frequencies of the highest detected emissions with a lower span and resolution bandwidth to increase the accuracy and note the frequency values.
- 5) If the EUT is portable or ceiling mounted, repeat steps 1 to 4 with other orientations (x,y,z) of the EUT.
- 6) Rotate the measuring antenna and repeat steps 1 to 5.

## 5.1.2.2 Final measurement 9 kHz to 30 MHz

In the second stage a final measurement is performed on an open area test site with no conducting ground plane at a measuring distance of 3 m, 10 m, or 30 m. If the standard requires larger measuring distances for a given frequency, the results are extrapolated according to section 15.31 (f) (2) [2]. The final measurement is performed with an EMI receiver set to Quasi-Peak detector, except for the frequency bands 9 kHz to 90 kHz and 110 kHz to 490 kHz where an Average detector is used according section 15.209 (d) [2].

At the frequencies, which were detected during the preliminary measurements, the final measurement is performed while rotating the EUT and the measuring antenna in the range of 0 ° to 360 ° around their vertical axis until the maximum level value is found.

The resolution bandwidth of the EMI receiver is set to the following values:

Frequency range	Resolution bandwidth	Measuring time	
9 kHz to 150 kHz	200 Hz	1 s	
150 kHz to 30 MHz	9 kHz	1 s	

Procedure final measurement:

The following procedure is used:

- 1) Monitor the selected frequencies from the preliminary measurement with the measuring antenna facing the EUT and an EUT azimuth of 0 °.
- 2) Rotate the EUT by 360 ° to maximize the detected signals.
- 3) Rotate the measuring antenna and repeat steps 1 to 2 until the maximum value is found and note it.
- 4) If the EUT is portable or ceiling mounted, repeat steps 1 to 3 with other orientations (x,y,z) of the EUT.

## 5.1.3 Radiated: 30 MHz to 1 GHz

## 5.1.3.1 Preliminary and final measurement 30 MHz to 1 GHz

The preliminary and final measurements are performed in a semi-anechoic chamber with a metal ground plane at a measuring distance of 3 meters. Table-top devices are set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices are placed directly on the turntable / ground plane. The setup of the equipment under test is in accordance with [1].

During the tests the EUT is rotated in the range of 0 ° to 360 °, the measuring antenna is set to horizontal and vertical polarization and raised and lowered in the range from 1 m to 4 m to find the maximum level of emissions.

The resolution bandwidth of the EMI receiver is set to the following values:

Test	Frequency range	Step-size	Resolution bandwidth	Measuring time	Detector
Preliminary measurement	30 MHz to 1 GHz	30 kHz	120 kHz	-	Peak Average
Frequency peak search	± 120 kHz	10 kHz	120 kHz	1 s	Peak
Final measurement	30 MHz to 1 GHz	-	120 kHz	1 s	QuasiPeak

Procedure preliminary measurement:

The following procedure is used:

- 1) Set the measuring antenna to 1 m height.
- 2) Monitor the frequency range at horizontal polarization of the measuring antenna and an EUT / turntable azimuth of 0 °.
- 3) Rotate the EUT by 360° to maximize the detected signals.
- 4) Repeat steps 2 to 3 with the vertical polarization of the measuring antenna.
- 5) Increase the height of the measuring antenna for 0.5 m and repeat steps 2 to 4 until the final height of 4 m is reached.
- 6) The highest values for each frequency are saved by the software, including the measuring antenna height and polarization and the turntable azimuth for that value.

Procedure final measurement:

The following procedure is used:

- 1) Select the highest frequency peaks (lowest margin to the limit) for the final measurement.
- 2) The software determines the exact peak frequencies by doing a partial scan with reduced step size of the pre-scan of the selected peaks.
- 3) If the EUT is portable or ceiling mounted, find the worst-case EUT orientation (x,y,z) for the final test.
- 4) The worst-case measuring antenna height is found via varying the height by +/- 0.5 m from the value obtained in the preliminary measurement while monitoring the emission level.
- 5) The worst-case turntable position is found via varying the turntable azimuth by +/- 30° from the value obtained in the preliminary measurement while monitoring the emission level.
- 6) The final measurement is performed at the worst-case measuring antenna height and the worst-case turntable azimuth.
- 7) Steps 2 to 6 are repeated for each frequency peak selected in step 1.

## 5.1.4 Method 99% bandwidth

The test is carried out in a shielded chamber. Table-top devices are set up on a table and the spectrum analyser is connected to a test fixture / loop antenna, which is placed around / on top of the EUT.

The test is carried out in a shielded chamber. Floor standing devices are set up on a floor and the spectrum analyser is connected to a test fixture / loop antenna, which is placed at the antenna of the EUT.

The following procedure will be used for the occupied bandwidth measurement according to [1]:

The occupied bandwidth is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers are each equal to 0.5% of the total mean power of the given emission. The following procedure shall be used for measuring 99% power bandwidth:

- a) The instrument center frequency is set to the nominal EUT channel center frequency. The frequency span for the spectrum analyzer shall be between 1.5 times and 5.0 times the OBW.
- b) The nominal IF filter bandwidth (3 dB RBW) shall be in the range of 1% to 5% of the OBW, and VBW shall be approximately three times the RBW, unless otherwise specified by the applicable requirement.
- c) Set the reference level of the instrument as required, keeping the signal from exceeding the maximum input mixer level for linear operation. In general, the peak of the spectral envelope shall be more than [10 log (OBW/RBW)] below the reference level. Specific guidance is given in 4.1.5.2.
- d) Step a) through step c) might require iteration to adjust within the specified range.

## 5.1.5 Conducted: AC power line

The test is carried out in a shielded chamber. Table-top devices are set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm above the ground plane. Floor-standing devices are placed directly on the ground plane. In case of DC powered equipment, which is not exclusively powered by a battery, it is connected to the LISN via a suitable AC/DC adaptor. The setup of the equipment under test is in accordance with [1].

The frequency range 150 kHz to 30 MHz is measured with an EMI receiver set to MAX hold mode with Peak and Average detectors and a resolution bandwidth of 9 kHz. A scan is carried out on the phase and neutral line of the AC mains network. If emissions less than 10 dB below the appropriable limit are detected, these emissions are measured with an Average and Quasi-Peak detector on all lines.

Frequency range	Resolution bandwidth	Measuring time	
150 kHz to 30 MHz	9 kHz	5 s

Remark \*\*: Measurement result was taken from preliminary test because of the noise floor of the outdoor test site.

#### Remark:

The limits in CFR 47, Part 15, Subpart C, paragraph 15.209 (a), are identical to those in RSS-GEN Section 8.9, Table 6, since the measurements are performed in terms of magnetic field strength and converted to electric field strength levels (as reported in the table) using the free space impedance of  $377 \Omega$ .

For example, the measurement frequency X kHz resulted in the level of Y dB $\mu$ V/m, which is equivalent to Y - 51.5 = Z dB $\mu$ A/m, which was the same margin, W dB, to the corresponding RSS-GEN Table 6 as it has to the 15.209(a) limit.

#### Test result: Passed

# 5.4 AC power-line conducted emissions

#### 5.4.1 Test setup (Conducted emissions on power supply lines)

Test setup (Conducted emissions on power supply lines)							
Used	Setup	See sub-clause	Comment				
$\boxtimes$	Conducted: AC power line	5.1.4	-				
	Not applicable, because	-	-				

#### 5.4.2 Test method (Conducted emissions on power supply lines)

Test setup (Conducted emissions on power supply lines)								
Used	Clause [1]	Name of method	Sub-clause	Comment				
	6.2	Tabletop equipment testing	-	-				
$\boxtimes$	6.2	Floor-standing equipment testing	5.1.4	Provided AC switching power adaptor				

The AC power adaptor provided by the applicant was used for the tests: Phoenix Contact TRIO-PS/1AC/24DC/5 Order.No: 2866310 The power adaptor itself was supplied by  $120V_{AC}$  60Hz.

## 5.4.3 Test results (Conducted emissions on power supply lines)

Ambient temperature:	22 °C	Date:	07.02.2025
Relative humidity:	20 %	Tested by:	M.DINTER

The curves in the diagrams below only represent for each frequency point the maximum measured value of all preliminary measurements which were made for each power supply line. The top measured curve represents the peak measurement and the bottom measured curve the average measurement. The quasi-peak measured points are marked by  $\blacklozenge$  and the average measured points by  $\blacktriangledown$ .

Frequency	QuasiPeak	Average	Limit	Margin	Line	PE	Corr.
[MHZ]	[αΒ(μν)]	[αΒ(μν)]	[αΒ(μν)]	[aB]			[aB]

# **6** Measurement Uncertainties

Conducted measurements				
Measurement method	Standard used for calculating measurement uncertainty	Expanded measurement uncertainty (95 %) U <sub>lab</sub>		
Frequency error	ETSI TR 100 028	4.5×10 <sup>-8</sup>		
Bandwidth measurements	-	9.0×10 <sup>-8</sup>		
Conducted emissions from 150 kHz to 30 MHz with LISN	CISPR 16-4-2	2.8 dB		

Radiated measurements					
Frequency error					
(Semi-) Anechoic chamber	ETSI TR 100 028	4.5×10⁻ <sup>8</sup>			
OATS	ETSI TR 100 028	4.5×10⁻ <sup>8</sup>			
Test fixture	ETSI TR 100 028	4.5×10⁻ <sup>8</sup>			
Bandwidth measurements					
(Semi-) Anechoic chamber	-	9.0×10⁻ <sup>8</sup>			
OATS	-	9.0×10⁻ <sup>8</sup>			
Test fixture	-	9.1×10⁻ <sup>8</sup>			
Radiated field strength M20					
CBL6112B @ 3 m 30 MHz – 1 GHz	CISPR 16-4-2	5.3 dB			
R&S HL050 @ 3 m					
1 – 6 GHz	CISPR 16-4-2	5.1 dB			
6 – 18 GHz	CISPR 16-4-2	5.4 dB			
Flann Standard Gain Horns 18 – 40 GHz	-	5.9 dB			
Radiated field strength M276					
R&S HL562E @ 3 m 30 MHz – 1 GHz	CISPR 16-4-2	4.8 dB			
R&S HL050 @ 3 m	-				
1 – 6 GHz	CISPR 16-4-2	5.1 dB			
6 – 18 GHz	CISPR 16-4-2	5.4 dB			
Flann Standard Gain Horns 18 – 40 GHz	-	5.9 dB			
OATS					
Field strength measurements below 30 MHz on OATS without ground plane	-	4.4 dB			

# 7 Test Equipment used for Tests

No.	Test equipment	Туре	Manufacturer	Serial No.	PM. No.	Cal. Date	Cal Due
1	Loop antenna	22.5 cm	PHOENIX TESTLAB GmbH	-	410085	Calibration not necessary	
2	EMI Receiver / Spectrum Analyser	ESR7	Rohde & Schwarz	101252	481734	22.02.2024	02.2026
3	Loop antenna	HFH2-Z2	Rohde & Schwarz	832609/014	480059	21.02.2024	02.2026
4	EMC test software	Elektra V5.10.00	Rohde&Schwarz		483755	Calibration not necessary	
5	RF Switch Matrix	OSP220	Rohde & Schwarz	101391	482976	Calibration not necessary	
6	Turntable	TT3.0-3t	Maturo	825/2612/.01	483224	Calibration not necessary	
7	Controller	NCD	Maturo	474/2612.01	483226	Calibration not necessary	
8	Semi Anechoic Chamber M276	SAC5-2	Albatross Projects	C62128-A540- A138-10-0006	483227	Calibration not necessary	
9	EMI receiver / Spectrum analyser	ESW44	Rohde & Schwarz	101828	482979	21.02.2024	02.2026
10	Outdoor test site	-	PHOENIX TESTLAB GmbH	-	480293	Calibration not necessary
