TEST REPORT

Applicant Name & : SHENZHEN DNS INDUSTRIES CO., LTD.
Address : 23/F Building A, Shenzhen International Innovation Center, No.1006 Shennan Road, Futian, Shenzhen, China

Sample Description

Product : Bluetooth Cassette
FCC ID : ZBC055
Model No. : QTGB16NH0001,BWA17WI055
Electrical Rating : DC 5V

Date Received : 20 December 2016
Date Test Conducted : 20 December 2016 – 12 January 2017
Test standards : 47 CFR PART 15 Subpart C: 2015 section 15.247

Test Result : Pass

Conclusion : The submitted samples complied with the above rules/standards.

Remark : TRF No.: FCC BT 3.0-a
Effective date: 01 July 2016

Prepared and Checked By:

Sky Zhu
Project Engineer
Intertek Guangzhou

Approved By:

2.0 General Description

2.1 Product Description

Operating Frequency	2402 MHz to 2480 MHz
Type of Modulation:	GFSK, ($\pi/4$)-DQPSK, 8-DPSK
Number of Channels	79 Channels
Channel Separation:	1 MHz
Dwell time	Per channel is less than 0.4s.
Antenna Type	Integral
Antenna gain:	0 dBi
Speciality:	Bluetooth 4.0 single mode with classic mode
Function:	Connect BT device to receive audio signal.
Power Supply:	DC 5V
Power cord:	None

Remark: The device meets the requirements stated within Parts 15.247(g) & (h) in that they were developed under the Bluetooth protocol and operate as a true frequency hopping system. The device does not have the ability to be coordinated with other FHSS systems in an effort to avoid the simultaneous occupancy of individual hopping frequencies by multiple transmitters.

EUT modulation and data packet during test:

For Normal mode:

The EUT has been tested on the Modulation of GFSK with DH1, DH3 and DH5 data packet.

For EDR mode:

1. The EUT been tested on the Modulation of ($\pi/4$)-DQPSK with 2DH1, 2DH3 and 2DH5 data packet.
2. The EUT has been tested on the Modulation of 8-DPSK with 3DH1, 3DH3 and 3DH5 data packet.

EUT channels and frequencies list:

Test frequencies are lowest channel 0: 2402 MHz, middle channel 39: 2441 MHz and highest channel 78: 2480 MHz.

Channel	Frequency (MHz)	Channel	Frequency (MHz)	Channel	Frequency (MHz)
0	2402	27	2429	54	2456
1	2403	28	2430	55	2457

Declaration on model difference:

Model QTGB16NH0001 was identical with BWA17WI055 in circuitry and electrical, mechanical and physical construction; the only differences are the appearance 、 trade name and model no. for trading purpose.

Trade name “DNS” is for model QTGB16NH0001

Trade name “Blackweb” is for model BWA17WI055

FCC ID: ZBC055

TRF No.: FCC BT 3.0-a

Report No.: 170118023GZU-001
Issued: 2017-01-20

2.2 Related Submittal(s) Grants

This is an application for certification of:
FHSS- Part 15 Spread Spectrum Transmitter (BT transmitter portion)

Remaining portions are subject to the following procedures:

1. Receiver portion of BT: exempt from technical requirement of this Part.

2.3 Test Methodology

Radiated emission measurements were performed according to the procedures in ANSI C63.10:2013. Radiated emission measurement was performed in semi-anechoic chamber, for radiated emission measurement, preliminary scans and final tests were performed in the semi-anechoic chamber to determine the worst case modes. All radiated tests were performed at an antenna to EUT distance of 3 meters, unless stated otherwise.

2.4 Test Facility

All of the tests are performed at:
Intertek Testing Services Shenzhen Ltd. Guangzhou Branch.
Block E, No.7-2 Guang Dong Software Science Park, Caipin Road, Guangzhou Science City,
GETDD Guangzhou, China 510663.

This test facility and site measurement data have been fully placed on file with the FCC, test firm registration number is 549654.

3.0 System Test Configuration

3.1 Justification

For emissions testing, the equipment under test (EUT) setup to transmit continuously to simplify the measurement methodology. Care was taken to ensure proper power supply voltages during testing.

The antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters. Radiated emissions are taken at three meters unless the signal level is too low for measurement at that distance. If necessary, a pre-amplifier is used and/or the test is conducted at a closer distance.

All readings are extrapolated back to the equivalent three meter reading using inverse scaling with distance. The spurious emissions more than 20 dB below the permissible value are not reported.

For an intentional radiator, the spectrum shall be investigated from the lowest radio frequency signal generated in the device, without going below 9 kHz, up to at least the frequency shown in the following table:

Frequency range of radiated emission measurements

Lowest frequency generated in the device	Upper frequency range of measurement
9 kHz to below 10 GHz	10th harmonic of highest fundamental frequency or to 40 GHz, whichever is lower
At or above 10 GHz to below 30 GHz	5th harmonic of highest fundamental frequency or to 100 GHz, whichever is lower
At or above 30 GHz	5th harmonic of highest fundamental frequency or to 200 GHz, whichever is lower, unless otherwise specified

Number of fundamental frequencies to be tested in EUT transmit band

Frequency range in which device operates	Number of frequencies	Location in frequency range of operation
1 MHz or less	1	Middle
1 MHz to 10 MHz	2	1 near top and 1 near bottom
More than 10 MHz	3	1 near top, 1 near middle and 1 near bottom

3.2 EUT Exercising Software

The test was performed under “BLUE TEST 3” which was provided by manufacture.

3.3 Special Accessories

No special accessories used.

3.4 Measurement Uncertainty

No.	Item	Measurement Uncertainty
1	RF output power (conducted)	1.1 dB
2	Occupied Channel Bandwidth	2.3%
3	Power Spectral Density	1.5dB
4	Spurious Emission (TX)-Radiated	4.7 dB (25 MHz-1 GHz)
		4.8 dB (1 GHz-18 GHz)
5	Spurious Emission (TX)-Conducted	1.5 dB
6	Spurious Emission (RX) -Radiated	4.7 dB (25 MHz-1 GHz)
		4.8 dB (1 GHz-18 GHz)
7	Spurious Emission (RX)-Conducted	1.5 dB
8	Temperature	0.5 °C
9	Humidity	0.4 %
10	Time	1.2%

When determining of the test conclusion, the Measurement Uncertainty of test has been considered.

Uncertainty and Compliance – Unless the standard specifically states that measured values are to be extended by the measurement uncertainty in determining compliance, all compliance determinations are based on the actual measured value.

3.5 Equipment Modification

Any modifications installed previous to testing by “SHENZHEN DNS INDUSTRIES CO., LTD.” will be incorporated in each production model sold / leased in the United States.
No modifications were installed by Intertek Testing Services Shenzhen Ltd. Guangzhou Branch.

3.6 Support Equipment List and Description

This product was tested with corresponding accessories as below:

Supplied by Intertek:

Description	Manufacturer	Model No.	SN/Certificate NO
NoteBook	Lenovo	T430	CNU8240LF9

4.0 Measurement Results

4.1 Antenna Requirement

Standard requirement

15.203 requirement:

For intentional device. According to 15.203, an intentional radiator shall be designed to Ensure that no antenna other than that furnished by the responsible party shall be used with the device.

15.247(c) (1)(i) requirement:

(i) Systems operating in the 2400-2483.5 MHz bands that are used exclusively for fixed. Point-to-point operations may employ transmitting antennas with directional gain greater than 6 dBi provided the maximum conducted output power of the intentional radiator is reduced by 1 dB for every 3 dB that the directional gain of the antenna exceeds 6 dBi.

EUT Antenna

The antenna is an integral antenna and no consideration of replacement. The best case gain of the antenna is 0 dBi.

4.2 20 dB Bandwidth

Test Requirement:	FCC Part 15 C section 15.247 (a)(1) Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.
Test Method:	ANSI C63.10: Clause 7.8.7 & 6.9.2
Test Status:	Pre-test the EUT in continuous transmitting mode at the lowest (2402 MHz), middle (2441 MHz) and highest (2480 MHz) channels with different data package. Compliance test in normal mode (DH5) and EDR mode (3DH5) as the worst case was found.

Test Configuration:

Test Procedure:

Removed the antenna from the EUT and then connect a low RF cable from the antenna port to the spectrum. The transmitter was operated at its maximum carrier power measured under normal test conditions.

1. The instrument center frequency was set to the nominal EUT channel center frequency. The frequency span for the spectrum analyzer was between two times and five times the

- OBW(20 dB Bandwidth).
2. The nominal IF filter bandwidth (3 dB RBW) was in the range of 1% to 5% of the OBW, and VBW was approximately three times the RBW.
 3. Set the reference level of the instrument as required, keeping the signal from exceeding the maximum input mixer level for linear operation. In general, the peak of the spectral envelope was more than $[10 \log (OBW/RBW)]$ below the reference level.
 4. Step 1) through step 3) might require iteration to adjust within the specified range.
 5. The dynamic range of the instrument at the selected RBW was more than 10 dB below the target “-20 dB down” requirement; that is, if the requirement calls for measuring the -20 dB OBW, the instrument noise floor at the selected RBW was at least 30 dB below the reference value.
 6. Peak detection and max hold mode (until the trace stabilizes) was used.
 7. Used the 20dB bandwidth function of the instrument and reported the measured bandwidth.
 8. The occupied bandwidth was reported by providing plot(s) of the measuring instrument display; the plot axes and the scale units per division was clearly labeled. Tabular data was reported in addition to the plot(s).

Test result:
Normal mode (DH5):

Test Channel	Bandwidth(MHz)	2/3 bandwidth(MHz)
Lowest	1.111	0.741
Middle	1.175	0.743
Highest	1.111	0.741

EDR mode (3DH5):

Test Channel	bandwidth	2/3 bandwidth
Lowest	1.375	0.917
Middle	1.368	0.912
Highest	1.375	0.917

Test result: The unit does meet the FCC requirements.

Result plot as follows:

Normal mode (DH5):

Lowest Channel(2.402 GHz):

Middle Channel(2.441 GHz):

Highest Channel(2.480 GHz):

EDR mode (3DH5):

Lowest channel(2.402 GHz):

Middle channel(2.441 GHz):

Highest channel(2.480 GHz):

4.3 Carrier Frequencies Separated

Test Requirement: FCC Part 15 C section 15.247

(a)(1) Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

Test Method: ANSI C63.10: Clause 7.8.2

Test Status: Pre-test the EUT in continuous transmitting mode at the lowest (2402 MHz), middle (2441 MHz) and highest (2480 MHz) channel and hopping mode with different data packet. Compliance test in hopping with normal mode (DH5) as the worst case was found.

Test Configuration:

Test Procedure:

1. Removed the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
2. Span: Wide enough to capture the peaks of two adjacent channels.
3. Set the spectrum analyzer: RBW =100 kHz, VBW $\geq$ RBW, Sweep = auto; Detector Function = Peak. Trace = Max hold.
4. Allowed the trace to stabilize. Use the marker-delta function to determine the separation between the peaks of the adjacent channels.

Report No.: 170118023GZU-001
Issued: 2017-01-20

Test result:

Test Channel	Carrier Frequencies Separated	Pass/Fail
Lower Channels (channel 0 and channel 1)	1013kHz	Pass
Middle Channels (channel 39 and channel 40)	1020kHz	Pass
Upper Channels (channel 77 and channel 78)	1013kHz	Pass

Remark:

The limit is the maximum two-thirds of the 20 dB bandwidth: 917 kHz.

Result plot as follows:

Test worst case mode: DH5

Lowest Channels: Carrier Frequencies Separated

Report No.: 170118023GZU-001
Issued: 2017-01-20

Middle Channels: Carrier Frequencies Separated

Highest Channels: Carrier Frequencies Separated

Test result: The unit does meet the FCC requirements.

4.4 Hopping Channel Number

Test Requirement: FCC Part15 C section 15.247
(a)(1)(iii) Frequency hopping systems in the 2400-2483.5 MHz band shall use at least 15 channels.

Test Method: ANSI C63.10: Clause 7.8.3

Test Status: Pre-test the EUT in hopping mode with different data packet. Compliance test in hopping with Normal mode (DH5) as the worst case was found.

Test Configuration:

Test Procedure:

1. Removed the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
2. Span: The frequency band of operation
3. Set the spectrum analyzer: RBW = 100 kHz. VBW = 300 kHz. Sweep = auto; Detector Function = Peak. Trace = Max hold.
4. Allowed the trace to stabilize.
5. Set the spectrum analyzer: start frequency = 2400 MHz, stop frequency = 2483.5 MHz. Submit the test result graph.

Test result: Total channels are 79 channels.

Test result: The unit does meet the FCC requirements.

4.5 Dwell Time**Test Requirement:** FCC Part 15 C section 15.247

(a)(1)(iii) Frequency hopping systems in the 2400-2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used.

Test Method: ANSI C63.10: Clause 7.8.4**Test Status:** Test the EUT in hopping mode at the lowest (2402 MHz), middle (2441 MHz) and highest (2480 MHz) channel with different data packet. Compliance test in hopping mode with EDR mode (3DH1, 3DH3 and 3DH5) as the worst case was found.**Test Configuration:****Test Procedure:**

1. Removed the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
2. Set spectrum analyzer span = 0, centered on a hopping channel.
3. Set RBW = 100 kHz and VBW = 300 kHz. Sweep = as necessary to capture the entire dwell time per hopping channel. Detector Function = Peak. Trace = Max hold;
4. Used the marker-delta function to determine the dwell time.

Test Result:

The test period: $T = 0.4 \text{ s} \times 79 \text{ Channel} = 31.6 \text{ s}$

1. Channel 0: 2.402 GHz									
3DH1 time slot	=	0.401	(ms)	*	32	*	(31.6/3.16)	=	128.320 ms
3DH3 time slot	=	1.667	(ms)	*	15	*	(31.6/3.16)	=	250.050 ms
3DH5 time slot	=	2.928	(ms)	*	11	*	(31.6/3.16)	=	322.080 ms
2. Channel 39: 2.441 GHz									
3DH1 time slot	=	0.397	(ms)	*	32	*	(31.6/3.16)	=	127.040 ms
3DH3 time slot	=	1.652	(ms)	*	16	*	(31.6/3.16)	=	264.320 ms
3DH5 time slot	=	2.913	(ms)	*	11	*	(31.6/3.16)	=	320.430 ms
3. Channel 78: 2.480 GHz									
3DH1 time slot	=	0.397	(ms)	*	32	*	(31.6/3.16)	=	127.040 ms
3DH3 time slot	=	1.638	(ms)	*	16	*	(31.6/3.16)	=	262.080 ms
3DH5 time slot	=	2.899	(ms)	*	11	*	(31.6/3.16)	=	318.890 ms

The average time of occupancy in the specified 31.6 second period is equal to pulse width x (number of pulse in observation period) x (test period / observation period)

The results are not greater than 0.4 seconds.

The unit does meet the FCC requirements.

Result plot as follows:

1. Lowest channel (2.402 GHz):

(1) 3DH1

Pulse Width:

Number of Pulses in 3.16 S observation period:

(2) 3DH3

Pulse Width:

Number of Pulses in 3.16 S observation period:

(3) 3DH5

Pulse Width:

Number of Pulses in 3.16 S observation period:

2. Middle Channel (2.441 GHz):

(1). 3DH1

Pulse Width:

Number of Pulses in 3.16 S observation period:

(2) 3DH3

Pulse Width:

Number of Pulses in 3.16 S observation period:

(3) 3DH5

Pulse Width:

Number of Pulses in 3.16 S observation period:

3. Highest Channel (2.480 GHz):

(1). 3DH1

Pulse Width:

Number of Pulses in 3.16 S observation period:

(2) 3DH3

Pulse Width:

Number of Pulses in 3.16 S observation period:

(3) 3DH5

Pulse Width:

Number of Pulses in 3.16 S observation period:

4.6 Pseudo random Frequency Hopping Sequence

4.6.1 Standard requirement

15.247(a)(1) requirement:

The system shall hop to channel frequencies that are selected at the system hopping rate from a Pseudo random ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

4.6.2 EUT Pseudo random Frequency Hopping Sequence

Bluetooth protocol is utilized by the EUT. It is shown that each frequency used equally on the average by the transmitter. The system receivers have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shift frequencies in synchronization with the transmitted signals.

4.7 Maximum Peak Conducted Output Power

Test Requirement: FCC Part 15 C section 15.247
(b)(1) For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1 watt. For all other frequency hopping systems in the 2400-2483.5 MHz band: 0.125 watts.

Test Method: ANSI C63.10: Clause 7.8.5

Test Status: Pre-test the EUT in continuous transmitting mode at the lowest (2402 MHz), middle (2441 MHz) and highest (2480 MHz) channel with different data packet. Compliance test in continuous transmitting mode with normal (DH5) and EDR mode (3DH5) as the worst case was found.

Test Configuration:

Test Procedure:

1. Removed the antenna from the EUT and then connect a low attenuation RF cable (cable loss=0.5 dB) from the antenna port to the spectrum.
2. Span: Approximately five times the 20 dB bandwidth, centered on a hopping channel.
3. Set the spectrum analyzer: RBW = 2 MHz (RBW > 20 dB bandwidth of the emission being measured) . VBW = 5 MHz Sweep = auto; Detector Function = Peak. Trace: Max hold.
4. Kept the EUT in transmitting at lowest, medium and highest channel with different data packet individually. Record the max value.

Test result:

Normal mode (DH5):				
Test Channel	Fundamental Frequency (MHz)	Output Power (dBm)	Limit (dBm)	Result
Lowest	2402	2.3	21.0	Pass
Middle	2441	2.7	21.0	Pass
Highest	2480	1.7	21.0	Pass
EDR mode(3DH5):				
Test Channel	Fundamental Frequency (MHz)	Output Power (dBm)	Limit (dBm)	Result
Lowest	2402	0.2	21.0	Pass
Middle	2441	1.0	21.0	Pass
Highest	2480	0.0	21.0	Pass
Remark: Cable lose=0.5 dB Level = Read Level + Cable Loss.				

Report No.: 170118023GZU-001

4.5 Out of Band Conducted Emissions

- Test Requirement:** FCC Part 15 C section 15.247
- (d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. Based on either an RF conducted or a radiated measurement. Provided the transmitter demonstrates compliance with the peak conducted power limits.
- Test Method:** ANSI C63.10: Clause 7.8.8
- Test Status:** Pre-test the EUT in continuous transmitting mode at the lowest (2402 MHz), middle (2441 MHz) and highest (2480 MHz) channel with different data packet. Compliance test in continuous transmitting mode with EDR mode (3DH5) as the worst case was found.

Test Configuration:

Test Procedure:

1. Removed the antenna from the EUT and then connect a low RF cable (cable loss =0.5dB) from the antenna port to the spectrum analyser.
2. Set the spectrum analyzer: RBW=100 kHz, VBW = 300 kHz. Sweep = auto; Detector Function = Peak. Trace = Max Hold, Scan up through 10th harmonic.
3. Measured the Conducted unwanted Emissions of the test frequency with special test status.
4. Repeated until all the test status was investigated.

Result plot as follows:

Lowest Channel 2402MHz: 30 M to 25 GHz

Issued: 2017-01-20

4.6 Out of Band Radiated Emissions

For out of band radiated emissions into Non-Restricted Frequency Bands were performed at a 3m separation distance to determine whether these emissions complied with the 20dB attenuation requirement.

- ☒ Not required, since all emissions are more than 20dB below fundamental
- ☐ See attached data sheet

4.7 Radiated Emissions in Restricted Bands

Test Requirement:	FCC Part 15 C section 15.247 (d) In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).
Test Method:	ANSI C63.10: Clause 6.4, 6.5 and 6.6
Test Status:	Pre-test the EUT in continuous transmitting mode at the lowest (2402 MHz), middle (2441 MHz) and highest (2480 MHz) channel with different data packet. Compliance test in continuous transmitting mode with EDR mode (3DH5) as the worst case was found.
Test site:	Measurement Distance: 3m (Semi-Anechoic Chamber)
Limit:	Section 15.209 40.0 dB μ V/m between 30MHz & 88MHz; 43.5 dB μ V/m between 88MHz & 216MHz; 46.0 dB μ V/m between 216MHz & 960MHz; 54.0 dB μ V/m above 960MHz.
Detector:	For Peak and Quasi-Peak value: RBW = 1 MHz for $f \geq 1$ GHz, 200 Hz for 9 kHz to 150 kHz 9 kHz for 150 kHz to 30 MHz 120 kHz for 30 MHz to 1GHz VBW $\geq$ RBW Sweep = auto Detector function = peak for $f \geq 1$ GHz, QP for $f < 1$ GHz Trace = max hold For AV value: RBW = 1 MHz for $f \geq 1$ GHz, 100 kHz for $f < 1$ GHz VBW=3M Hz Detector function =AV detector Sweep = auto Trace = max hold

Test Configuration:

1) 9 kHz to 30 MHz emissions:

2) 30 MHz to 1 GHz emissions:

3) 1 GHz to 40 GHz emissions:

Test Procedure:

1) 9 kHz to 30 MHz emissions:

For testing performed with the loop antenna. The centre of the loop was positioned 1 m above the ground and positioned with its plane vertical at the special distance from the EUT. During testing the loop was rotated about its vertical axis for maximum response at each azimuth and also investigated with the loop positioned in the horizontal plane.

2) 30 MHz to 1 GHz emissions:

For testing performed with the bi-log type antenna. The measurement is performed with the EUT rotated 360°, the antenna height scanned between 1m and 4m, and the antenna rotated to repeat the measurement for both the horizontal and vertical antenna polarizations.

3) 1 GHz to 25 GHz emissions:

Test site with RF absorbing material covering the ground plane that met the site validation criterion called out in CISPR 16-1-4:2010 was used to perform radiated emission test above 1 GHz.

For testing performed with the horn antenna. The measurement is performed with the EUT rotated 360°, the antenna height scanned between 1m and 4m, and the antenna rotated to repeat the measurement for both the horizontal and vertical antenna polarizations.

4) The receiver was scanned from 9 kHz to 25 GHz. When an emission was found, the table was rotated to produce the maximum signal strength. An initial pre-scan was performed for in peak detection mode using the receiver. The EUT was measured for both the Horizontal and Vertical polarities and performed a pre-test three orthogonal planes. For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. The worst case emissions were reported.

As shown in Section, for frequencies above 1000 MHz. the above field strength limits are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation.

No any other emissions level which are attenuated less than 20dB below the limit.

4.8 Band Edges Requirement

Test Requirement:	FCC Part 15 C section 15.247 (d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating. The radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. Based on either an RF conducted or a radiated measurement. Provided the transmitter demonstrates compliance with the peak conducted power limits.
Frequency Band:	2400 MHz to 2483.5 MHz
Test Method:	ANSI C63.10: Clause 7.8.6 & 6.10
Test Status:	Pre-test the EUT in continuous transmitting mode at the lowest (2402 MHz), and highest (2480 MHz) channel and hopping mode with different data packet. Compliance test in continuous transmitting mode with Normal mode (DH5) as the worst case was found.
Test Configuration:	For Band Edges Emission in Radiated mode, Please refer to clause 4.7

Test Procedure:	For Band Edges Emission in Radiated mode, Please refer to clause 4.7
-----------------	--

1. Removed the antenna from the EUT and then connect a low RF cable from the antenna port to the spectrum analyzer or power meter.
2. Set RBW of spectrum analyzer to 100 kHz and VBW of spectrum analyzer to 300 kHz with suitable frequency span including 100 kHz bandwidth from band edge.
3. Repeated until all the test status was investigated.
4. Reported the worst case.

Test result with plots as follows:

For conducted mode:

The band edges was measured and recorded Result:

The Lower Edges attenuated more than 20dB.

The Upper Edges attenuated more than 20dB.

Result plot as follows:

Normal mode (DH5):

Lowest channel: 2.402 GHz

Continues transmit mode

Hopping mode

Report No.: 170118023GZU-001
Issued: 2017-01-20

Highest Channel: 2.480 GHz

Continues transmit mode

Hopping mode

For radiated mode:

Please refer Clause 4.7 Radiated Emissions in Restricted Bands of this test report for more details. The resultant field strength in band edges meet the general radiated emission limit in section 15.209, which does not exceed 74 dB μ V/m (Peak Limit) and 54dB μ V/m (Average Limit).

4.9 Conducted Emission Test

Test result: Not applicable

Test Configuration:

Test Setup and Procedure

Test was performed according to ANSI C63.10 Clause 6.2. The EUT was set to achieve the maximum emission level. The mains terminal disturbance voltage was measured with the EUT in a shielded room. The EUT was connected to AC power source through an Artificial Mains Network which provides a 50Ω linear impedance. Artificial hand is used if appropriate (for handheld apparatus). The load/control terminal disturbance voltage was measured with passive voltage probe if appropriate.

The table-top EUT was placed on a 0.8m high non-metallic table above earthed ground plane (Ground Reference Plane). And for floor standing EUT, was placed on a 0.1m high non-metallic supported on GRP. The EUT keeps a distance of at least 0.8m from any other of the metallic surface. The Artificial Mains Network is situated at a distance of 0.8m from the EUT.

During the test, mains lead of EUT excess 0.8m was folded back and forth parallel to the lead so as to form a horizontal bundle with a length between 0.3m and 0.4m.

The bandwidth of test receiver was set at 9 kHz. The frequency range from 150 kHz to 30MHz was checked.

Pre-test on all modes and only the worst case data had been report.
