

**FCC Test Report** 

Report No.: HK2406123064-E

Test Report
On Behalf of
Shenzhen Jinlangmei Technology Co., Ltd.
For
Wireless headset
Model No.: SK19

FCC ID: 2BHAT-SK19

Prepared For: Shenzhen Jinlangmei Technology Co., Ltd.

202, Building 2, Tianhao Industrial Park, No. 2852 Songbai Road, Bao'an

Distrit, Shenzhen, 518108 China

Prepared By: Shenzhen HUAK Testing Technology Co., Ltd.

1-2/F., Building B2, Junfeng Zhongcheng Zhizao Innovation Park, Heping,

Fuhai Street, Bao'an District, Shenzhen, Guangdong, China

Date of Test: Jun. 12, 2024 ~ Jun. 25, 2024

Date of Report: Jun. 25, 2024

Report Number: HK2406123064-E

## **Test Result Certification**

Applicant's Name .....: Shenzhen Jinlangmei Technology Co., Ltd.

Bao'an Distrit, Shenzhen, 518108 China

Manufacturer's Name......: Shenzhen Jinlangmei Technology Co., Ltd.

Bao'an Distrit, Shenzhen, 518108 China

**Product Description** 

Trade Mark......N/A

Product Name ...... Wireless headset

Model and/or type reference...: SK19

Standards 47 CFR FCC Part 15 Subpart C 15.247

# 1. Summary

## 1.1. Test Standards

The tests were performed according to following standards:

FCC Rules Part 15.247: Frequency Hopping, Direct Spread Spectrum and Hybrid Systems that are in operation within the bands of 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz

ANSI C63.10:2013: American National Standard for Testing Unlicensed Wireless Devices

## 1.2. Test Description

| FCC PART 15.247            |  |      |
|----------------------------|--|------|
| FCC Part 15.207            | AC Power Conducted Emission                    | PASS |
| FCC Part 15.215            | 20dB Bandwidth& 99% Bandwidth                  | PASS |
| FCC Part 15.247(d)         | Spurious RF Conducted Emission                 | PASS |
| FCC Part 15.247(b)         | Maximum Peak Output Power                      | PASS |
| FCC Part 15.247 (a) (1)    | Pseudorandom Frequency Hopping Sequence        | PASS |
| FCC Part 15.247(a)(1)(iii) | Number of Hopping Frequency& Time of Occupancy | PASS |
| FCC Part 15.247(a)(1)      | Frequency Separation                           | PASS |
| FCC Part 15.205/15.209     | Radiated Emissions                             | PASS |
| FCC Part 15.247(d)         | Band Edge Compliance of RF Emission            | PASS |

The results shown in this test report refer only to the sample(s) tested unless otherwise stated and the sample(s) are retained for 30 days only. The document is issued by HUAK, this document cannont be reproduced except in full with our prior written permission. The more details and the authenticity of the report will be confirmed at http://www.cer-mark.com.

## 1.3. Information of the Test Laboratory

Shenzhen HUAK Testing Technology Co., Ltd.

Add.: 1-2/F., Building B2, Junfeng Zhongcheng Zhizao Innovation Park, Heping, Fuhai Street, Bao'an District, Shenzhen, Guangdong, China

Testing Laboratory Authorization:

A2LA Accreditation Code is 4781.01. FCC Designation Number is CN1229. Canada IC CAB identifier is CN0045. CNAS Registration Number is L9589.

## 1.4. Statement of the Measurement Uncertainty

The data and results referenced in this document are true and accurate. The reader is cautioned that there may be errors within the calibration limits of the equipment and facilities. The measurement uncertainty was calculated for all measurements listed in this test report acc. to CISPR 16 - 4 "Specification for radio disturbance and immunity measuring apparatus and methods – Part 4: Uncertainty in EMC Measurements" and is documented in the Shenzhen HUAK Testing Technology Co., Ltd. quality system acc. to DIN EN ISO/IEC 17025. Furthermore, component and process variability of devices similar to that tested may result in additional deviation. The manufacturer has the sole responsibility of continued compliance of the device.

Hereafter the best measurement capability for HUAK laboratory is reported:

| Test                                    | Measurement<br>Uncertainty | Notes |
|---|----------------------------|-------|
| Transmitter power conducted             | ±0.37dB                    | (1)   |
| Transmitter power Radiated              | ±3.35dB                    | (1)   |
| Conducted spurious emission 9KHz-40 GHz | ±2.20dB                    | (1)   |
| Occupied Bandwidth                      | ±3.68%                     | (1)   |
| Radiated Emission 30~1000MHz            | ±3.90dB                    | (1)   |
| Radiated Emission Above 1GHz            | ±4.28dB                    | (1)   |
| Conducted Disturbance0.15~30MHz         | ±2.71dB                    | (1)   |

<sup>(1)</sup> This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2.

AFICATION.

Report No.: HK2406123064-E

2. General Information

## 2.1. Environmental Conditions

During the measurement the environmental conditions were within the listed ranges:

| N. TESTI | Normal Temperature: | 25°C    | NY TESTIN |
|----------|---------------------|---------|-----------|
| HO       | Relative Humidity:  | 55 %    | AD HOW    |
|          | Air Pressure:       | 101 kPa |           |

## 2.2. General Description of EUT

| Product Name:         | Wireless headset   |          |
|-----------------------|--|----------|
| Model/Type Reference: | SK19   | .G @     |
| Series Model:         | N/A  | ESTIN    |
| Model Difference:     | N/A  |          |
| Power Supply:         | DC 5V from Type-C or DC 3.7V from Battery  | 100      |
| Version:              | Supported EDR  | KTESTING |
| Modulation:           | GFSK, π/4DQPSK, 8DPSK  |          |
| Operation Frequency:  | 2402MHz~2480MHz  | G        |
| Channel Number:       | 79 Maria Man |          |
| Channel Separation:   | 1MHz   |          |
| Antenna Type:         | Ceramic Antenna  | TING A   |
| Antenna Gain:         | 2.0dBi   |          |
| Hardware Version:     | V2.0   |          |
| Software Version:     | V2.0   | , Ça     |

Note: For more details, refer to the user's manual of the EUT.

The results shown in this test report refer only to the sample(s) tested unless otherwise stated and the sample(s) are retained for 30 days only. The document is issued by HUAK, this document cannont be reproduced except in full with our prior written permission. The more details and the authenticity of the report will be confirmed at http://www.cer-mark.com.

## 2.3. Description of Test Modes and Test Frequency

The Applicant provides communication tools software to control the EUT for staying in continuous transmitting and receiving mode for testing.

There are 79 channels provided to the EUT and Channel 00/39/78 was selected for testing.

**Operation Frequency:** 

| Operation Frequency: | - WATER - WATER - WATER |
|----------------------|-------------------------|
| Channel              | Frequency (MHz)         |
| 00                   | 2402                    |
| 01 MOM               | 2403                    |
| © "                  |                         |
| 38                   | 2440                    |
| 39                   | 2441                    |
| 40                   | 2442                    |
| :                    | :                       |
| 77                   | 2479                    |
| 78                   | 2480                    |
| /8                   | 2480                    |

Note: The line display in grey were the channel selected for testing

Preliminary tests were performed in each mode and packet length of BT, and found worst case as bellow, finally test were conducted at those mode and recorded in this report.

**Test Items Worst Case** Conducted Emissions DH5 Middle channel DH<sub>5</sub> Radiated Emissions and Band Edge Maximum Conducted Output Power DH5/2DH5/3DH5 20dB Bandwidth & 99% Bandwidth DH5/2DH5/3DH5 Frequency Separation DH5/2DH5/3DH5 Middle channel Number of hopping frequency DH5/2DH5/3DH5 DH1/DH3/DH5 Middle channel 2DH1/2DH3/2DH5 Middle channel Time of Occupancy (Dwell Time) 3DH1/3DH3/3DH5 Middle channel DH5/2DH5/3DH5 Out-of-band Emissions

The results shown in this test report refer only to the sample(s) tested unless otherwise stated and the sample(s) are retained for 30 days only. The document is issued by HUAK, this document cannont be reproduced except in full with our prior written permission. The more details and the authenticity of the report will be confirmed at http://www.cer-mark.com

2.4. Equipments Used during the Test

| Item | Equipment                             | Manufacturer    | Model No.                  | Serial No. | Last Cal.     | Cal.<br>Interval |
|------|---------------------------------------|-----------------|----------------------------|------------|---------------|------------------|
| 1.   | L.I.S.N.                              | R&S             | ENV216                     | HKE-002    | Feb. 20, 2024 | 1 Year           |
| 2.   | L.I.S.N.                              | R&S             | ENV216                     | HKE-059    | Feb. 20, 2024 | 1 Year           |
| 3.   | EMI Test Receiver                     | R&S             | ESR                        | HKE-010    | Feb. 20, 2024 | 1 Year           |
| 4.   | Spectrum analyzer                     | Agilent         | N9020A                     | HKE-025    | Feb. 20, 2024 | 1 Year           |
| 5.   | Spectrum analyzer                     | R&S             | FSV3044                    | HKE-126    | Feb. 20, 2024 | 1 Year           |
| 6.   | Preamplifier                          | EMCI            | EMC051845S                 | HKE-048    | Feb. 20, 2024 | 1 Year           |

The calibration interval was one year

The results shown in this test report refer only to the sample(s) tested unless otherwise stated and the sample(s) are retained for 30 days only. The document is issued by HUAK, this document cannont be reproduced except in full with our prior written permission. The more details and the authenticity of the report will be confirmed at http://www.cer-mark.com.

2.5. Related Submittal(s) / Grant (s)

This submittal(s) (test report) is intended to comply with Section 15.247 of the FCC Part 15, Subpart C Rules.

#### 2.6. Modifications

No modifications were implemented to meet testing criteria.

## 2.7. Description of Test Setup

Operation of EUT during conducted testing:

Operation of EUT during radiation testing:

The sample was placed (0.8m below 1GHz, 1.5m above 1GHz) above the ground plane of 3m chamber. Measurements in both horizontal and vertical polarities were performed. During the test, each emission was maximized by: having the EUT continuously working, investigated all operating modes, rotated about all 3 axis (X, Y & Z) and considered typical configuration to obtain worst position, manipulating interconnecting cables, rotating the turntable, varying antenna height from 1m to 4m in both horizontal and vertical polarizations. The emissions worst-case are shown in Test Results of the following pages. The worst case is X position.

The results shown in this test report refer only to the sample(s) tested unless otherwise stated and the sample(s) are retained for 30 days only. The document is issued by HUAK, this document cannont be reproduced except in full with our prior written permission. The more details and the authenticity of the report will be confirmed at http://www.cer-mark.com.

# 2.8. Description of Support Units

The EUT has been tested as an independent unit together with other necessary accessories or support units. The following support units or accessories were used to form a representative test configuration during the tests.

| Y | Item | Equipment        | Trade Mark | Model/Type No. | Specification   | Note       |
|---|------|------------------|------------|----------------|---|------------|
|   | 1    | Wireless headset | N/A        | SK19           | N/A   | EUT        |
|   | 2    | Adapter          | N/A        | N/A            | Input: AC100-240V,<br>50/60Hz, 0.75A<br>Output: 5V 2A | Peripheral |

#### Note:

- 1. All the equipment/cables were placed in the worst-case configuration to maximize the emission during the test.
- 2. Grounding was established in accordance with the manufacturer's requirements and conditions for the intended use
- 3. For conducted measurements (Output Power, 6dB Emission Bandwidth, Power Spectral Density, Spurious Emissions), the antenna of EUT is connected to the test equipment via temporary antenna connector, the antenna connector is soldered on the antenna port of EUT, and the temporary antenna connector is listed in the Test Instruments.

The results shown in this test report refer only to the sample(s) tested unless otherwise stated and the sample(s) are retained for 30 days only. The document is issued by HUAK, this document cannont be reproduced except in full with our prior written permission. The more details and the authenticity of the report will be confirmed at http://www.cer-mark.com.

## 3. Test Conditions and Results

## 3.1. Conducted Emissions Test

#### Limit

According to FCC CFR Title 47 Part 15 Subpart C Section 15.207 and RSS Gen 8.8, AC Power Line Conducted Emissions Limits for License-Exempt Radio Apparatus as below:

| Francisco (MIII)      | Limit (d   | dBuV)     |
|-----------------------|--|-----------|
| Frequency range (MHz) | Quasi-peak   | Average   |
| 0.15-0.5              | 66 to 56*  | 56 to 46* |
| 0.5-5                 | 56 May 11 May 12 | 46        |
| 5-30                  | 60   | 50        |

<sup>\*</sup> Decreases with the logarithm of the frequency.

## **Test Configuration**

## **Test Procedure**

- The equipment was set up as per the test configuration to simulate typical actual usage per the user's manual. The EUT is a tabletop system; a wooden table with a height of 0.8 meters is used and is placed on the ground plane as per ANSI C63.10.
- Support equipment, if needed, was placed as per ANSI C63.10.
- All I/O cables were positioned to simulate typical actual usage as per ANSI C63.10.
- The adapter received AC120V/60Hz power through a Line Impedance Stabilization Network (LISN) which supplied power source and was grounded to the ground plane.
- All support equipments received AC power from a second LISN, if any.
- 6. The EUT test program was started. Emissions were measured on each current carrying line of the EUT using a spectrum Analyzer / Receiver connected to the LISN powering the EUT. The LISN has two monitoring points: Line 1 (Hot Side) and Line 2 (Neutral Side). Two scans were taken: one with Line 1 connected to Analyzer / Receiver and Line 2 connected to a 50 ohm load; the second scan had Line 1 connected to a 50 ohm load and Line 2 connected to the Analyzer / Receiver.
- 7. Analyzer / Receiver scanned from 150 KHz to 30MHz for emissions in each of the test modes.
- During the above scans, the emissions were maximized by cable manipulation.

The results shown in this test report refer only to the sample(s) tested unless otherwise stated and the sample(s) are retained for 30 days only. The document is issued by HUAK,

## 3.2. Radiated Emissions and Band Edge

#### Limit

For intentional device, according to § 15.209(a), the general requirement of field strength of radiated emission out of authorized band shall not exceed the following table at a 3 meters measurement distance.

In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a)

Except when the requirements applicable to a given device state otherwise, emissions from License-Exempt transmitters shall comply with the field strength limits shown in table below. Additionally, the level of any transmitter emission shall not exceed the level of the transmitter's fundamental emission

Unwanted emissions that fall into restricted bands shall comply with the limits specified in RSS-Gen; and Unwanted emissions that do not fall within the restricted frequency bands shall comply either with the limits specified in the applicable RSS or with those specified in this RSS-Gen.

#### Radiated Emission Limits

|    | Frequency (MHz) | Distance (Meters) | Radiated (dBµV/m)                | Radiated (µV/m) |

## **Test Configuration**

#### (A) Radiated Emission Test Set-Up, Frequency Below 30MHz

The results shown in this test report refer only to the sample(s) tested unless otherwise stated and the sample(s) are retained for 30 days only. The document is issued by HUAK, this document cannont be reproduced except in full with our prior written permission. The more details and the authenticity of the report will be confirmed at http://www.cer-mark.com

(B) Radiated Emission Test Set-Up, Frequency below 1000MHz

Report No.: HK2406123064-E

(C) Radiated Emission Test Set-Up, Frequency above 1000MHz

#### **Test Procedure**

- 1. The EUT was placed on turn table which is 0.8m above ground plane for below 1GHz test, and on a low permittivity and low loss tangent turn table which is 1.5m above ground plane for above 1GHz test.
- 2. Maximum procedure was performed by raising the receiving antenna from 1m to 4m and rotating the turn table from 0° to 360° to acquire the highest emissions from EUT.
- 3. And also, each emission was to be maximized by changing the polarization of receiving antenna both horizontal and vertical.
- 4. Repeat above procedures until all frequency measurements have been completed.

#### **Test Results**

#### Remark:

- 1. Radiated Emission measured at GFSK,  $\pi/4$  DQPSK, 8DPSK mode from 9 KHz to 10th harmonic of fundamental and recorded worst case at GFSK DH5 mode.
- 2. There is no emission found except system noise floor in 9 KHz to 30MHz and not recorded in this report.
- For below 1GHz testing recorded worst at GFSK DH5 low channel.

The results shown in this test report refer only to the sample(s) tested unless otherwise stated and the sample(s) are retained for 30 days only. The document is issued by HUAK, this document cannont be reproduced except in full with our prior written permission. The more details and the authenticity of the report will be confirmed at http://www.cer-mark.com.

#### Remark:

- (1) Measuring frequencies from 1 GHz to the 25 GHz.
- (2) "F" denotes fundamental frequency; "H" denotes spurious frequency. "E" denotes band edge frequency.
- (3) \* denotes emission frequency which appearing within the Restricted Bands specified in provision of 15.205, then the general radiated emission limits in 15.209 apply.
- (4) The emissions are attenuated more than 20dB below the permissible limits are not recorded in the report.
- (5) The IF bandwidth of EMI Test Receiver between 30MHz to 1GHz was 120KHz, 1 MHz for measuring above 1 GHz, below 30MHz was 10KHz. The resolution bandwidth of test receiver/spectrum analyzer is 1MHz and video bandwidth is 3MHz for peak measurement with peak detector at frequency above 1GHz. The resolution bandwidth of test receiver/spectrum analyzer is 1MHz and video bandwidth is 10Hz for Average measurement with peak detection at frequency above 1GHz.
- (6) When the test results of Peak Detected below the limits of Average Detected, the Average Detected is not need completed. For example: Top Channel at Fundamental 73.16dBuV/m (PK Value) <93.98(AV Limit), at harmonic 53.20 dBuV/m (PK Value) <54 dBuV/m (AV Limit), the Average Detected not need to completed.
- (7)All modes of operation were investigated and the worst-case emissions are reported.

Remark: Factor = Antenna Factor + Cable Loss – Pre-amplifier;Level = Reading + Factor; Margin = Level - Limit.

Remark: All the other emissions not reported were too low to read and deemed to comply with FCC limit.

#### Remark

- 1. If the PK measured levels comply with average limit, then the average level were deemed to comply with average limit.
- 2. In restricted bands of operation, the spurious emissions below the permissible value more than 20dB.
- 3. The amplitude of spurious emissions which are attenuated by more than 20dB below the permissible value has no need to be reported.

3.3. Maximum Peak Conducted Output Power

#### Limit

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudo randomly ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

#### **Test Procedure**

Remove the antenna from the EUT and then connect a low loss RF cable from the antenna port to the power sensor.

## **Test Configuration**

WANTED.

## 3.4. 20dB Bandwidth

#### **Limit**

For frequency hopping systems operating in the 2400MHz-2483.5MHz no limit for 20dB bandwidth.

#### **Test Procedure**

The transmitter output was connected to the spectrum analyzer through an attenuator. The bandwidth of the fundamental frequency was measured by spectrum analyzer with 30 KHz RBW and 100 KHz VRW

The 20dB bandwidth is defined as the total spectrum the power of which is higher than peak power minus 20dB.

The occupied bandwidth is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers are each equal to 0.5% of the total mean power of the given emission. The following procedure shall be used for measuring 99% power bandwidth:

RBW=1% to 5% of the OBW VBW=approximately 3 X RBW Detector=Peak

Trace Mode: Max Hold

Use the 99% power bandwidth function of the instrument to measure the Occupied Bandwidth and recoded.

#### **Test Configuration**

#### **Test Results**

## 3.5. Frequency Separation

## **Limit**

Frequency hopping systems shall have hopping channel carrier frequencies separated by minimum of 25 KHz or the 2/3\*20dB bandwidth of the hopping channel, whichever is greater.

## **Test Procedure**

The transmitter output was connected to the spectrum analyzer through an attenuator. The bandwidth of the fundamental frequency was measured by spectrum analyzer with 30 KHz RBW and 100 KHz VBW.

2-DH5

# 3.8. Out-of-Band Emissions

#### Limit

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF con-ducted or a radiated measurement, pro-vided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter com-plies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required.

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the RF power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided that the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of root-mean-square averaging over a time interval, as permitted under Section 5.4(4), the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general field strength limits specified in RSS-Gen is not required.

#### **Test Procedure**

Connect the transmitter output to spectrum analyzer using a low loss RF cable, and set the spectrum analyzer to RBW=100 kHz, VBW= 300 kHz, peak detector, and max hold. Measurements utilizing these setting are made of the in-band reference level, band edge and out-of-band emissions.

## **Test Configuration**

#### **Test Results**

Remark: The measurement frequency range is from 30MHz to the 10th harmonic of the fundamental frequency. The lowest, middle and highest channels are tested to verify the spurious emissions and bandage measurement data.

We measured all conditions (DH1, DH3, DH5) and recorded worst case at DH5 and 2DH5, 3DH5

# 3.9. Pseudorandom Frequency Hopping Sequence

#### **Test Applicable**

# For 47 CFR Part 15C section 15.247 (a) (1):

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hop-ping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400–2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudo randomly ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hop-ping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

# **EUT Pseudorandom Frequency Hopping Sequence Requirement**

The pseudorandom frequency hopping sequence may be generated in a nice-stage shift register whose 5<sup>th</sup> and 9<sup>th</sup> stage outputs are added in a modulo-two addition stage. And the result is fed back to the input of the first stage. The sequence begins with the first one of 9 consecutive ones, for example: the shift register is initialized with nine ones.

- Number of shift register stages:9
- Length of pseudo-random sequence:29-1=511 bits
- Longest sequence of zeros:8(non-inverted signal)

Linear Feedback Shift Register for Generation of the PRBS sequence

An example of pseudorandom frequency hopping sequence as follows:

Each frequency used equally one the average by each transmitter.

The system receiver have input bandwidths that match the hopping channel bandwidths of their corresponding transmitter and shift frequencies in synchronization with the transmitted signals.

# 3.10. Antenna Requirement

#### Standard Applicable

For intentional device, according to FCC 47 CFR Section 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. And according to FCC 47 CFR Section 15.247, if transmitting antennas of directional gain greater than 6dBi are used, the power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6dBi.

Report No.: HK2406123064-E

#### Refer to Statement Below For Compliance.

The manufacturer may design the unit so that the user can replace a broken antenna, but the use of a standard antenna jack or electrical connector is prohibited. Further, this requirement does not apply to intentional radiators that must be professionally installed.

### **Antenna Connected Construction**

The antenna used in this product is a Ceramic antenna which permanently attached. It conforms to the standard requirements. The directional gains of antenna used for transmitting is 2.0dBi.
