Radio Test Report

FCC Part 95 MedRadio Transmitter

Model: Battery Charger

FCC ID: 2AY43-GDCH1

COMPANY: CCC del Uruguay Medical Devices
General Paz 1371
Montevideo, MON 11400-UY

TEST SITE(S): National Technical Systems
41039 Boyce Road.
Fremont, CA. 94538-2435

PROJECT NUMBER: PR136033

REPORT DATE: December 1, 2021

FINAL TEST DATES: April 15, 16 and 19 and October 12, 2021

TOTAL NUMBER OF PAGES: 49

This report and the information contained herein represent the results of testing of only those articles / products identified in this document and selected by the client. The tests were performed to specifications and/or procedures selected by the client. National Technical Systems (NTS) makes no representations expressed or implied that such testing fully demonstrates efficiency, performance, reliability, or any other characteristic of the articles being tested, or similar products. This report should not be relied upon as an endorsement or certification by NTS of the equipment tested, nor does it present any statement whatsoever as to its merchantability or fitness of the test article or similar products, for a particular purpose. This report shall not be reproduced except in full without written approval from NTS.

SCOPE

Tests have been performed on the CCC del Uruguay Medical Devices model Battery Charger, pursuant to the relevant requirements of the following standard(s) in order to obtain device certification against the regulatory requirements of the Federal Communications Commission.

- Code of Federal Regulations (CFR) Title 47 Part 2
- CFR 47 Part 95 Subpart I (Medical Device Radio Communication Service)

Conducted and radiated emissions data has been collected, reduced, and analyzed within this report in accordance with measurement guidelines set forth in the following reference standards and as outlined in National Technical Systems test procedures:

ANSI C63.4:2014
ANSI TIA-603-D

Every practical effort was made to perform an impartial test using appropriate test equipment of known calibration. All pertinent factors have been applied to reach the determination of compliance.

National Technical Systems is accredited by the A2LA, certificate number 0214.26, to perform the test(s) listed in this report, except where noted otherwise.

The test results recorded herein are based on a single type test of the CCC del Uruguay Medical Devices model Battery Charger and therefore apply only to the tested sample. The sample was selected and prepared by Agustin Villavedra of CCC del Uruguay Medical Devices.

OBJECTIVE

The primary objective of the manufacturer is compliance with the regulations outlined in the previous section.

Certification is a procedure where the manufacturer submits test data and technical information to a certification body and receives a certificate or grant of equipment authorization upon successful completion of the certification body's review of the submitted documents. Once the equipment authorization has been obtained, the label indicating compliance must be attached to all identical units, which are subsequently manufactured.

Maintenance of compliance is the responsibility of the manufacturer. Any modification of the product which may result in increased emissions should be checked to ensure compliance has been maintained (i.e., printed circuit board layout changes, different line filter, different power supply, harnessing or I/O cable changes, etc.).

STATEMENT OF COMPLIANCE

The tested sample of CCC del Uruguay Medical Devices model Battery Charger complied with the requirements of the standards and frequency bands declared in the scope of this test report.

Maintenance of compliance is the responsibility of the manufacturer. Any modifications to the product should be assessed to determine their potential impact on the compliance status of the device with respect to the standards detailed in this test report.

DEVIATIONS FROM THE STANDARDS

No deviations were made from the published requirements listed in the scope of this report.

TEST RESULTS

FCC Part 95

Rule Part	Description	Measured	Limit	Result
Transmitter frequency, power, bandwidth, modulation and unwanted emissions

§2.1055 §95.2565	Frequency stability	-11.6 ppm	100 ppm	
§2.1093	RF Exposure	Refer to separate exhibit	-	
§2.1033 (c) (8)	Final radio frequency amplifying circuit's dc voltages and currents for normal operation over the power range	3.0V 6.5mA		

EXTREME CONDITIONS

Frequency stability is determined over extremes of temperature and voltage. As the device is hand carried, battery powered equipment, the supply voltage was reduced to the battery operating end point of 3.3Vdc as specified by the manufacturer.

The extremes of temperature were 25°C to 45°C as specified in FCC §95.628(e)(1).

The extremes of temperature were 0°C to +55°C as specified in FCC §95.628(e)(2) for stations in the Medical Device Radiocommunication Service.

MEASUREMENT UNCERTAINTIES

ISO Guide 17025 requires that an estimate of the measurement uncertainties associated with the emissions test results be included in the report. The measurement uncertainties given below are based on a 95% confidence level (based on a coverage factor (k=2) and were calculated in accordance with NAMAS document NIS 81 and M3003.

Measurement Type	Measurement Unit	Frequency Range	Expanded Uncertainty
RF frequency	Hz	25 to 7,000 MHz	1.7×10^{-7}
Radiated emission (substitution method)	dBm	25 to 40,000 MHz	± 2.5 dB
Radiated emission (field strength)	dBμV/m	25 to 1,000 MHz 1 to 40 GHz	± 3.6 dB ± 6.0 dB

EQUIPMENT UNDER TEST (EUT) DETAILS**GENERAL**

The CCC del Uruguay Medical Devices model Battery Charger is a charger that is designed to charge batteries in an implant. Since the EUT could be placed in any position during operation, the EUT was treated as tabletop equipment during testing to simulate the end-user environment. The electrical rating of the EUT is 4.2VDC from the supplied AC charger.

The sample was received on April 13, 2021 and tested on April 15, 16 and 19 and October 12, 2021. The EUT consisted of the following component(s):

Company	Model	Description	Serial Number	FCC ID
CCC dell Uruguay	13-100-005	Guardio Charger	000047	2AY43-GDCH1
Cell-Con	452241-LA	1-cell Li-Ion charger	000008	-

OTHER EUT DETAILS

The following EUT details should be noted: The 3G radio module is disabled in firmware. The Battery Charger transmits a wake-up signal at 13.56 MHz and then communicates with an implant using the MICS band.

ANTENNA SYSTEM

The antenna system consists of an integral chip.

ENCLOSURE

The EUT enclosure is primarily constructed of plastic. It measures approximately 9 cm wide by 15 cm deep by 3.5 cm high.

MODIFICATIONS

No modifications were made to the EUT during the time the product was at NTS Silicon Valley.

SUPPORT EQUIPMENT

The following equipment was used as local support equipment for testing:

Company	Model	Description	Serial Number	FCC ID
CCC Del Uruguay	CCM X11	Implant	A00032	2AY43-CCMX11
CCC Del Uruguay	CCM X11	Implant	A00022	2AY43-CCMX11

Note: One IPG paired with the Battery Charger was used for each test but not both for the same test.

The following equipment was used as remote support equipment for testing:

Company	Model	Description	Serial Number	FCC ID
Getac				
Impulse Dynamics	13-100-007	Intelio Programming Interface	000082	N/A
Impulse Dynamics	13-100-008	Intelio Programming Wand	000081	2AY43-INPW0

EUT INTERFACE PORTS

The I/O cabling configuration during testing was as follows:

Port	Connected To	Cable(s)		
		Description	Shielded or Unshielded	Length(m)
Charger Wand cable	Wand	Multiwire	Unshielded	1.4
Charging	AC Adapter	Two wire	Unshielded	1.6

EUT OPERATION

During emissions testing the EUT was commanded via the programming wand using scripts on the tablet to operate in the desired mode for the particular test (i.e. Tx Modulated 400 MHz for continuous transmit on a channel in the 402-405 MHz band, Tx Modulated 13 MHz for continuous transmit at 13.56 and Rx Emissions, or Search Loop for continuous attempts to establish a link in the MICS band).

TESTING**GENERAL INFORMATION**

Final test measurements were taken at the test sites listed below. Pursuant to section 2.948 of the FCC's Rules, NTS has been recognized as an accredited test laboratory by the Commission. A description of the facilities employed for testing is maintained by NTS.

Site	Designation / Registration Numbers	Location
Chamber 4 & 5	US1031	41039 Boyce Road Fremont, CA 94538-2435

ANSI C63.4 recommends that ambient noise at the test site be at least 6 dB below the allowable limits. Ambient levels are below this requirement. The test site(s) contain separate areas for radiated and conducted emissions testing. Results from testing performed in this chamber have been correlated with results from an open area test site. Considerable engineering effort has been expended to ensure that the facilities conform to all pertinent requirements of ANSI C63.4.

BANDWIDTH MEASUREMENTS

The 6dB, 20dB and/or 26dB signal bandwidth is measured in using the bandwidths recommended by ANSI C63.4. When required, the 99% bandwidth is measured using the methods detailed in RSS GEN. The measurement bandwidth is set to be at least 1% of the instrument's frequency span.

FREQUENCY STABILITY

The EUT is placed inside a temperature chamber with all support and test equipment located outside of the chamber. The temperature is varied across the specified frequency range in 10 degree increments with frequency measurements made at each temperature step. The EUT is allowed enough time to stabilize at each temperature variation.

The spectrum analyzer is configured to give a 5- or 6-digit display for the marker-frequency function. The spectrum analyzer's built-in frequency counter is used to measure the maximum deviation of the fundamental frequency at each temperature. Where possible the device is set to transmit an unmodulated signal. Where this is not possible the frequency drift is determined by finding a stable point on the signal (e.g. the null at the centre of an OFDM signal) or by calculating a centre frequency based on the upper and lower XdB points (where X is typically 6dB or 10dB) on the signal's skirts.

RADIATED EMISSIONS MEASUREMENTS

Receiver radiated spurious emissions measurements are made in accordance with ANSI C63.4:2014 by measuring the field strength of the emissions from the device at a specific test distance and comparing them to a field strength limit. Where the field strength limit is specified at a longer distance than the measurement distance the measurement is extrapolated to the limit distance.

Transmitter radiated spurious emissions are initially measured as a field strength. The eirp or erp limit as specified in the relevant rule part(s) is converted to a field strength at the test distance and the emissions from the EUT are then compared to that limit. Emissions within 20dB of this limit are the subjected to a substitution measurement.

All radiated emissions measurements are performed in two phases. A preliminary scan of emissions is conducted in either an anechoic chamber or on an OATS during which all significant EUT frequencies are identified with the system in a nominal configuration. At least two scans are performed across the complete frequency range of interest and at each operating frequency identified in the reference standard. One or more of these is with the antenna polarized vertically while the one or more of these is with the antenna polarized horizontally. Initial scans are made using a peak detector (RBW=VBW) and using scan rates to ensure that the EUT transmits before the sweep moves out of each resolution bandwidth (for transmit mode).

During the preliminary scans, the EUT is rotated through 360°, the antenna height is varied and cable positions are varied to determine the highest emission relative to the limit. For transmitter spurious emissions, where the limit is expressed as an effective radiated power, the eirp or erp is converted to a field strength limit.

Final measurements are made on an OATS or in a semi-anechoic chamber at the significant frequencies observed during the preliminary scan(s) using the same process of rotating the EUT and raising/lowering the measurement antenna to find the highest level of the emission. The field strength is recorded and, for receiver spurious emissions, compared to the field strength limit. For the final measurement the appropriate detectors (average, peak, normal, sample, quasi-peak) are used. For receiver measurements below 1GHz the detector is a Quasi-Peak detector, above 1GHz a peak detector is used and the peak value (RB=VB=1MHz) and average value (RB=1MHz, VB=10Hz) are recorded.

For transmitter spurious emissions, the radiated power of all emissions within 20dB of the calculated field strength limit are determined using a substitution measurement. The substitution measurement is made by replacing the EUT with an antenna of known gain (typically a dipole antenna or a double-ridged horn antenna), connected to a signal source. The output power of the signal generator is adjusted until the maximum field strength from the substitution antenna is similar to the field strength recorded from the EUT. The erp of the EUT is then calculated.

INSTRUMENTATION

An EMI receiver as specified in CISPR 16-1-1 is used for radiated emissions measurements. The receivers used can measure over the frequency range of 9 kHz up to 7000 MHz. These receivers allow both ease of measurement and high accuracy to be achieved. The receivers have Peak, Average, and CISPR (Quasi-peak) detectors built into their design so no external adapters are necessary.

For measurements above the frequency range of the receivers and for all conducted measurements a spectrum analyzer is utilized because it provides visibility of the entire spectrum along with the precision and versatility required to support engineering analysis.

Measurement bandwidths for the test instruments are set in accordance with the requirements of the standards referenced in this document.

Software control is used to correct the measurements for transducer factors (e.g. antenna) and the insertion loss of cables, attenuators and other series elements to obtain the final measurement value. This provides faster, more accurate readings by performing the conversions described under Sample Calculations within the Test Procedures section of this report. Results are exported in a graphic and/or tabular format, as appropriate.

FILTERS/ATTENUATORS

External filters and precision attenuators are often connected between the EUT antenna port or receiving antenna and the test receiver. This eliminates saturation effects and non-linear operation due to high amplitude transient events.

ANTENNAS

A combination of biconical, log periodic or bi-log antennas are used to cover the range from 30 MHz to 1000 MHz. Broadband antennas or tuned dipole antennas are used over the entire 25 to 1000 MHz frequency range as the reference antenna for substitution measurements.

Above 1000 MHz, a dual-ridge guide horn antenna or octave horn antenna are used as reference and measurement antennas.

The antenna calibration factors are included in site factors that are programmed into the test receivers and instrument control software when measuring the radiated field strength.

ANTENNA MAST AND EQUIPMENT TURNTABLE

The antennas used to measure the radiated electric field strength are mounted on a non-conductive antenna mast equipped with a motor-drive to vary the antenna height.

Table mounted devices are placed on a non-conductive table at a height of 80 centimeters above the floor. Floor mounted equipment is placed on the ground plane if the device is normally used on a conductive floor or separated from the ground plane by insulating material from 3 to 12 mm if the device is normally used on a non-conductive floor. The EUT is positioned on a motorized turntable to allow it to be rotated during testing to determine the angle with the highest level of emissions.

SAMPLE CALCULATIONS**SAMPLE CALCULATIONS - CONDUCTED SPURIOUS EMISSIONS**

Measurements are compared directly to the conducted emissions specification limit (decibel form). The calculation is as follows:

$$R_r - S = M$$

where:

R_r = Measured value in dBm

S = Specification Limit in dBm

M = Margin to Specification in +/- dB

SAMPLE CALCULATIONS - RADIATED FIELD STRENGTH

Measurements of radiated field strength are compared directly to the specification limit (decibel form). The receiver and/or control software corrects for cable loss, preamplifier gain, and antenna factor. The calculations are in the reverse direction of the actual signal flow, thus cable loss is added and the amplifier gain is subtracted. The Antenna Factor converts the voltage at the antenna coaxial connector to the field strength at the antenna elements.

A distance factor is used when measurements are made at a test distance that is different to the specified limit distance by using the following formula:

$$F_d = 20 * \log_{10} (D_m/D_s)$$

where:

F_d = Distance Factor in dB

D_m = Measurement Distance in meters

D_s = Specification Distance in meters

For electric field measurements below 30MHz the extrapolation factor is either determined by making measurements at multiple distances or a theoretical value is calculated using the formula:

$$F_d = 40 * \log_{10} (D_m/D_s)$$

The margin of a given emission peak relative to the limit is calculated as follows:

$$R_c = R_r + F_d$$

and

$$M = R_c - L_s$$

where:

- R_R = Receiver Reading in dBuV/m
 F_d = Distance Factor in dB
 R_C = Corrected Reading in dBuV/m
 L_S = Specification Limit in dBuV/m
 M = Margin in dB Relative to Spec

SAMPLE CALCULATIONS –RADIATED POWER

The erp/eirp limits for transmitter spurious measurements are converted to a field strength in free space using the following formula:

$$E = \frac{\sqrt{30 P G}}{D}$$

where:

- E = Field Strength in V/m
 P = Power in Watts
 G = Gain of isotropic antenna (numeric gain) = 1
 D = measurement distance in meters

The field strength limit is then converted to decibel form (dBuV/m) and the margin of a given emission peak relative to the limit is calculated (refer to *SAMPLE CALCULATIONS –RADIATED FIELD STRENGTH*).

When substitution measurements are required (all signals with less than 20dB of margin relative to the calculated field strength limit) the eirp of the spurious emission is calculated using:

$$P_{EUT} = P_S - (E_S - E_{EUT})$$

and

$$P_S = G + P_{in}$$

where:

- P_S = effective isotropic radiated power of the substitution antenna (dBm)
 P_{in} = power input to the substitution antenna (dBm)
 G = gain of the substitution antenna (dBi)
 E_S = field strength the substitution antenna (dBm) at eirp P_S
 E_{EUT} = field strength measured from the EUT

Where necessary the effective isotropic radiated power is converted to effective radiated power by subtracting the gain of a dipole (2.2dBi) from the eirp value.

RADIATED SPURIOUS EMISSIONS SPECIFICATION LIMITS

The table below shows the limits for the spurious emissions from receivers as detailed in FCC Part 95.2579(a)(5).

Frequency Range (MHz)	Limit (uV/m @ 3m)	Limit (dBuV/m @ 3m)
30 to 88	100	40
88 to 216	150	43.5
216 to 960	200	46.0
Above 960	500	54.0

Radiated Emissions

Test Specific Details

Objective: The objective of this test session is to perform engineering evaluation testing of the EUT with respect to the specification listed above.

Date of Test: 4/15-16/2021

Config. Used: 1

Test Engineer: D. Bare, D. Demici, M. Birgani

Config Change: None

Test Location: Fremont Chamber #4

EUT Voltage: Battery

General Test Configuration

The EUT was located on the turntable for radiated emissions testing. The EUT was tested in all three orthogonal orientations.

The test distance and extrapolation factor (if applicable) are detailed under each run description.

Note, preliminary testing indicates that the emissions were maximized by orientation of the EUT and elevation of the measurement antenna. Maximized testing indicated that the emissions were maximized by orientation of the EUT, elevation of the measurement antenna, and manipulation of the EUT's interface cables.

Ambient Conditions:

Temperature: 24-25 °C

Rel. Humidity: 33-34 %

Summary of Results

Run #	Test Performed	Limit	Result	Value / Margin
2	Fundamental Signal Field Strength	FCC Part 95.2569	Pass	80.6 dBμV/m @ 402.45 MHz (margin: -4.6 dB)
2	Transmitter Radiated Spurious Emissions, 25 - 4,100 MHz	FCC Part 95.2579	Pass	20.6 dBμV/m @ 38.68 MHz (margin: -19.4 dB)
3	20dB Bandwidth	FCC Part 95	Pass	240 kHz
3	20dBc Frequencies	FCC Part 95	Pass	> 20dBc below the fundamental
4	Receiver Radiated Spurious Emissions, 25 - 4,100 MHz	FCC Part 15	Pass	20.6 dBμV/m @ 38.68 MHz (margin: -19.4 dB)

Modifications Made During Testing

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

		Class:	N/A

OOB emissions per FCC 95.2579

The delta in emissions level from the inband level to the level at 402.45 MHz is 39.0 dB. Subtracting this from the field strength of the fundamental at 1 MHz gives a value of 41.6 dBuV/m which complies with the spurious limit of 46 dBuV/m.

The delta in emissions level from the in band level to the highest level > 150 kHz from the center is 22.7 dB. The power of any unwanted emission is thus -37.3 dBm since the power of the wanted emissions is -14.6 dBm calculated from the 80.6 dBuV/m FS.

Run #4: Receiver Spurious Emissions

Frequency Range	Test Distance	Limit Distance	Extrapolation Factor
25 - 4,100 MHz	3	3	0.0

Not necessary as all emissions from the EUT while transmitting except the fundamental were below the receiver limits

LBT, FCC Part 95 & EN 301 839 v2.1.1

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 4/26/2021
 Test Engineer: M. Birgani; D. Bare
 Test Location: Fremont Chamber #2

Config. Used: See each run
 Config Change: None
 EUT Voltage: Battery

General Test Configuration

The EUT and all local support equipment were located on the table for LBT testing.

Ambient Conditions: Temperature: 22 °C
 Rel. Humidity: 36 %

Summary of Results - Device Operating in the 402-405 MHz Band

Run #	Mode	Test	Requirement / Limit	Result / Margin
1	Normal operation	LBT Threshold power level	-98.2 dBm	Pass
2	Normal operation	Monitoring system bandwidth	> 20 dB EBW	Pass
3	Normal operation	Monitoring system scan cycle time	> 10 ms	Pass
4	Normal operation	Monitoring system Minimum Channel monitoring period	0.1 ms / 10 ms	Pass
5	Normal operation	Channel access based on ambient level above PTh	Correct channel selection	Pass
6	Normal operation	Use of pre-scanned alternative channel	The EUT does not use this feature	N/A

Modifications Made During Testing

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

Sample Notes

Sample S/N: 000047

Client:	CCC del Uruguay Medical Devices	Job Number:	PR136033
Model:	Battery Charger	T-Log Number:	TL136033-RA-BC
Contact:	Agustin Villavedra	Project Manager:	Christine Krebill
Standard:	FCC Parts 15, 18, 95, EN 55011, EN 301 839	Project Coordinator:	David Bare
		Class:	B, Group 2

Run #1: LBT Threshold power level (5.3.7.1.3)

Test Configuration Details:

The Signal Generator B was off. The Signal Generator A (PSG vector signal generator) was configured to produce 7 un-modulated carriers at 7 of the 8 channels at;

Ch1	402.45 MHz	-98.2 dBm	Ch6	403.95 MHz	-98.2 dBm
Ch2	402.75 MHz	-98.2 dBm	Ch7	404.25 MHz	-98.2 dBm
Ch3	403.05 MHz	-98.2 dBm	Ch8	404.55 MHz	-98.2 dBm
Ch4	403.35 MHz	-98.2 dBm			
Ch5	403.65 MHz	Turned off			

Stated Antenna Gain: -5.0 dBi

Minimum LBT threshold power = $10 \log B \text{ (Hz)} - 150 + G \text{ (dBi)}$

When B: 240000 Hz (20 dB bandwidth)

Minimum LBT threshold power = -101.2 dBm

EUT Mode:

The EUT was placed in search mode looking for an implanted device. At this amplitude, the EUT must initiate communications on the channel 5 (403.65 MHz) not generated by the signal generator.

Test result:

The EUT complies with this requirement. EUT starts to initiate communication only at channel 5.

Client:	CCC del Uruguay Medical Devices	Job Number:	PR136033
Model:	Battery Charger	T-Log Number:	TL136033-RA-BC
Contact:	Agustin Villavedra	Project Manager:	Christine Krebill
Standard:	FCC Parts 15, 18, 95, EN 55011, EN 301 839	Project Coordinator:	David Bare
		Class:	B, Group 2

Run #2: Monitoring system bandwidth (5.3.7.1.4)

Test Configuration Details:

The PSG signal generator was configured to produce 7 un-modulated carriers at 7 of the 8 channels at;

Ch1	402.45 MHz	-98.2 dBm	Ch6	403.95 MHz	-98.2 dBm
Ch2	402.75 MHz	-98.2 dBm	Ch7	404.25 MHz	-98.2 dBm
Ch3	403.05 MHz	-98.2 dBm	Ch8	404.55 MHz	-98.2 dBm
Ch4	403.35 MHz	-98.2 dBm			
Ch5	403.65 MHz	Turned off			
Pa:	-105.2 dBm	@403.650 MHz			
Pb:	-87.2 dBm	@403.530 MHz	D1:	18.0 dB	Pass
Pc:	-88.2 dBm	@403.770 MHz	D2:	17.0 dB	Pass

Test result:

Pb – Pa = 5 dB and Pc – Pa = 6 dB, the EUT complies with the 20 dB monitoring bandwidth requirement.

Client:	CCC del Uruguay Medical Devices	Job Number:	PR136033
Model:	Battery Charger	T-Log Number:	TL136033-RA-BC
Contact:	Agustin Villavedra	Project Manager:	Christine Krebill
Standard:	FCC Parts 15, 18, 95, EN 55011, EN 301 839	Project Coordinator:	David Bare
		Class:	B, Group 2

Run #3: Monitoring system scan cycle time (5.3.7.1.5.1)

Note: The EUT performs a clear channel assessment prior to initiating any transmission

Test Configuration Details:

The PSG signal generator was configured to produce 7 un-modulated carriers at 7 of the 8 channels at;

Ch1	402.45 MHz	-98.2 dBm	Ch6	403.95 MHz	-98.2 dBm
Ch2	402.75 MHz	-98.2 dBm	Ch7	404.25 MHz	-98.2 dBm
Ch3	403.05 MHz	-98.2 dBm	Ch8	404.55 MHz	-98.2 dBm
Ch4	403.35 MHz	-98.2 dBm			
Ch5	403.65 MHz	Turned off			

The MXG signal generator was configured to produce 1 un-modulated carrier at channel (403.65 MHz). The output of the generators were combined. The amplitude of the MXG generator was adjusted to be 3dB above the amplitude of the PSG generator. The EUT was set to initiate a communication session. The EUT shall not transmit at 403.65 MHz. The MXG generator was switched off and the EUT was set to initiate a transmission at the same time. The time period from the point at which the MXG generator was switch off until the EUT transmitted on 403.65 MHz was measured.

Test result:

The first use of the channel after removal of the signal from Gen B at fc was 731ms. Once the communication establishes, it does not stop transmitting without manual intervention. the EUT complies with this requirement.

Client:	CCC del Uruguay Medical Devices	Job Number:	PR136033
Model:	Battery Charger	T-Log Number:	TL136033-RA-BC
Contact:	Agustin Villavedra	Project Manager:	Christine Krebill
Standard:	FCC Parts 15, 18, 95, EN 55011, EN 301 839	Project Coordinator:	David Bare
		Class:	B, Group 2

Run #4: Monitoring system Minimum Channel monitoring period (5.3.7.1.5.1.2)

Test Configuration Details:

The PSG signal generator was configured to produce 7 un-modulated carriers at 7 of the 8 channels with -98.2+3 dBm

Ch1	402.45 MHz	-98.2 dBm	Ch6	403.95 MHz	-98.2 dBm
Ch2	402.75 MHz	-98.2 dBm	Ch7	404.25 MHz	-98.2 dBm
Ch3	403.05 MHz	-98.2 dBm	Ch8	404.55 MHz	-98.2 dBm
Ch4	403.35 MHz	-98.2 dBm			
Ch5	403.65 MHz	Turned off			

The MXG signal generator was configured to produce 1 un-modulated carrier at channel (403.65 MHz). The output of the generators were combined. The amplitude of the MXG generator was adjusted to be equal to the amplitude of the PSG generator.

The output of the PSG generator was switched off and the EUT was set to initiate a transmission. The EUT did not transmit at 403.65 MHz. The output of the PSG was switched back on and the amplitude increased by 3 dB. The EUT was set to initiate a transmission. The EUT only transmitted at 403.65 MHz. The PSG generator was configured with **pulse modulation** on all the carriers. The modulation was 0.1 ms pulse with a repetition rate of 10 ms corresponding to a silent period between pulses of 9.9 ms. The EUT was set to initiate a transmission 10 times. In each case, the EUT only transmitted at 403.65 MHz

Test result:

The test was repeated 10 times and the channel selection occurred only on 403.65 MHz in each test run. The EUT complies with this requirement.

Client:	CCC del Uruguay Medical Devices	Job Number:	PR136033
Model:	Battery Charger	T-Log Number:	TL136033-RA-BC
Contact:	Agustin Villavedra	Project Manager:	Christine Krebill
Standard:	FCC Parts 15, 18, 95, EN 55011, EN 301 839	Project Coordinator:	David Bare
		Class:	B, Group 2

Run #5: Channel access based on ambient level above PTh (5.3.7.1.6)

Test Configuration Details:

The PSG signal generator was configured to produce 7 un-modulated carriers at 7 of the 8 channels

Ch1	402.45 MHz	-91.2 dBm			
Ch2	402.75 MHz	-98.2 dBm			
Ch3	403.05 MHz	-91.2 dBm			
Ch4	403.35 MHz	-91.2 dBm			
Ch5	403.65 MHz	-104.2 dBm	Increased:	-95.2 dBm	(MXG)
Ch6	403.95 MHz	-91.2 dBm			
Ch7	404.25 MHz	-91.2 dBm			
Ch8	404.55 MHz	-91.2 dBm			

The MXG signal generator was configured to produce 1 un-modulated carrier at channel 5 (403.65 MHz) with 9 dB below the threshold level.

The EUT was set to initiate a transmission, it only transmitted at 403.65 MHz. The amplitude of the MXG generator was increased 9 dB and the EUT was set to initiate a transmission. The EUT only selected 402.75 MHz.

Test result:

The EUT complies with this requirement.

LBT, FCC Part 95 & EN 301 839 v2.1.1

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 10/12/2021 14:20
Test Engineer: David Bare
Test Location: Fremont Chamber #2

Config. Used: 1
Config Change: None
EUT Voltage: Battery

General Test Configuration

The EUT and all local support equipment were located on the table for LBT testing.

Ambient Conditions:
Temperature: 20 °C
Rel. Humidity: 34 %

Summary of Results

Run #	Mode	Test	Requirement / Limit	Result / Margin
1	Normal operation	Discontinuation of MICS session	< 5 seconds	Pass

Modifications Made During Testing

No modifications were made to the EUT during testing. Prior to testing, the software in the EUT was updated.

Deviations From The Standard

No deviations were made from the requirements of the standard.

Stated Antenna Gain: -5.0 dBi
Minimum LBT threshold power = $10 \log B \text{ (Hz)} - 150 + G \text{ (dBi)}$
When B: 240000 Hz (20 dB bandwidth)
Minimum LBT threshold power = -101.2 dBm

EMC Test Data

Client:	CCC del Uruguay Medical Devices	PR Number:	PR136033

Ch2	402.75 MHz	-98.2 dBm			
Ch3	403.05 MHz	-91.2 dBm			
Ch4	403.35 MHz	-91.2 dBm			
Ch5	403.65 MHz	-104.2 dBm	Increased:	-95.2 dBm	(MXG)
Ch6	403.95 MHz	-91.2 dBm			
Ch7	404.25 MHz	-91.2 dBm			
Ch8	404.55 MHz	-91.2 dBm			

The MXG signal generator was configured to produce 1 un-modulated carrier at channel 5 (403.65 MHz)

The EUT was set to initiate a transmission to communicate with the implant. The EUT transmitted at 403.65 MHz. The Implant was removed from the test setup to block the communications. From the point in time when the Implant was blocked to the end of transmissions from the EUT was 4.1 seconds. After the implant is introduced to the test setup, no transmissions were observed.

EMC Test Data

Client:	CCC del Uruguay Medical Devices	PR Number:	PR136033
Model:	Battery Charger	T-Log Number:	TL136033-RA-BC
Contact:	Agustin Villavedra	Project Manager:	Christine Krebill
Standard:	FCC Parts 15, 18, 95, EN 55011, EN 301 839	Project Engineer:	David Bare
		Class:	B, Group 2

Test result:

The transmissions from the EUT has stopped in less than 5 seconds and did not re-initiate, the EUT complied with this requirement

FCC Part 95 & EN 301 839 Frequency Stability

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

General Test Configuration

With the exception of the radiated spurious emissions tests, all measurements are made with the EUT's rf port connected to the measurement instrument via an attenuator or dc-block if necessary. All amplitude measurements are adjusted to account for the attenuation between EUT and measuring instrument. For frequency stability measurements the EUT was placed inside an environmental chamber.

Radiated measurements are made with the EUT located on a non-conductive table, 3m from the measurement antenna.

Ambient Conditions:

Temperature: 23-24 °C

Rel. Humidity: 41-42 %

Summary of Results

Run #		Test Performed	Limit	Pass / Fail	Result / Margin
1		Frequency Stability	± 100ppm	Pass	-10.8ppm

Modifications Made During Testing

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

Run #1: Frequency Stability

Date of Test: 4/19/2021

Test Engineer: David Bare

Test Location: Fremont EMC Lab #4B

Config. Used: 1

Config Change: None

EUT Voltage: Battery

Nominal Frequency: 402.45 MHz

Frequency Stability Over Temperature

The EUT was soaked at each temperature for a minimum of 30 minutes prior to making the measurements to ensure the EUT and chamber had stabilized at that temperature.

Temperature	Frequency Measured	Drift	
(Celsius)	(MHz)	(Hz)	(ppm)
0	402.447270	-2730	-6.8
10	402.446752	-3248	-8.1
20	402.446310	-3690	-9.2
30	402.445833	-4167	-10.4
40	402.445647	-4353	-10.8
50	402.446067	-3933	-9.8
55	402.447954	-2046	-5.1
Worst case:		-4353	-10.8

Frequency Stability Over Input Voltage

Nominal Voltage is 3.7Vdc.

Extreme Voltage declared by CCC Del Uruguay is when battery is at 10% of capacity

Voltage	Frequency Measured	Drift		Temperature
	(MHz)	(Hz)	(ppm)	°C
10%	402.446460	-3540	-8.8	0
Nominal	402.447270	-2730	-6.8	0
10%	402.446167	-3833	-9.5	55
Nominal	402.447954	-2046	-5.1	55
Worst case:		-3833	-9.5	

Battery endpoint is 3.3 Vdc representing 0% capacity

Note 1: CCC Del Uruguay declared that below 2.64V there is a reset circuit that is triggered shutting down the device.
