Measuring Procedure:

The procedure used was based on ANSI STANDARD C63.4-1992. The spectrum was scanned from 30MHz to 1000MHz. When an emission was found, the table was rotated to produce the maximum signal strength. The antenna was placed in both the horizontal and vertical planes and the worse case emissions were reported. The EUT was tested in vertical and cylindrical dimension, thus the orthogonal plane in X, Y and Z axis were covered.
