| Transmitter Radiated Emissions | 15.407(b)(1-8) 15.209, 15.205 | RSS-247, 6.2.1 | Complies |
| Frequency stability | 15.407(g) | RSS-Gen | Complies |
| Antenna Requirement | 15.203 | RSS-Gen | Complies. The EUT uses internal antenna. |

EUT receive date: April 07, 2017

EUT receive condition: The pre-production version of the EUT was received in good condition

with no apparent damage. As declared by the Applicant, it is identical to

the production units.

Test start date: May 1, 2017

Test completion date: July 19, 2017

The test results in this report pertain only to the item tested.

2.0 General Description

2.1 Product Description

Verifone, Inc. supplied the following description of the EUT:

The M400 is an Electronic Payment/POS Terminal for Retail. For more information, see user's manual provided by the manufacturer.

The information about the 5GHz radio, installed in the model M400 WIFI/BT, is presented below.

| Applicant | Verifone, Inc. |
|-------------------------|-------------------------------------|
| Model No. | M400 WIFI/BT |
| FCC ID | B32M400WIFIBT |
| IC | 787C-M400WIFIBT |
| Use of Product | Point of Sale Terminal |
| Rated RF Output | 11.32 dBm for 5745~5825 MHz |
| Master or Client Device | Client |
| Frequency Range | U-NII 3: 5725 – 5850 MHz |
| Type of modulation | OFDM |
| Antenna(s) & Gain | Internal Antenna, 3.0 dBi peak gain |
| Manufacturer Name & | Verifone, Inc. |
| Address | 1400 W Stanford Ranch Rd. |
| | Rocklin, CA 95765 |
| | USA |

The EUT supports the following configurations:

| | Channels in 5725 – 5850 MHz band | | | | | |
|--------|----------------------------------|------|------------|--------|---------|--|
| Number | Frequency, MHz | 80 | 2.11a/n | 802.11 | n 40MHz | |

2.2 Related Submittal(s) Grants

None.

2.3 Test Methodology

Antenna conducted measurements were performed according to the FCC documents "Guidelines for Compliance Testing of Unlicensed National Information Infrastructure (U-NII) Devices Part 15, Subpart E" (789033 D02 General U-NII Test Procedures New Rules v01r04).

Both AC mains line-conducted and radiated emissions measurements were performed according to the procedures in ANSI C63.4. Radiated tests were performed at an antenna to EUT distance of 3 meters, unless stated otherwise in the **"Data Sheet"** of this Application.

All other measurements were made in accordance with the procedures in part 2 of CFR 47.

2.4 Test Facility

The test site used to collect the radiated data is site 1 (10-m semi-anechoic chamber). This test facility and site measurement data have been fully placed on file with the FCC, IC and A2LA accredited.

2.5 Measurement Uncertainty

Compliance with the limits was based on the results of the measurements and doesn't take into account the measurement uncertainty.

Estimated Measurement Uncertainty

| Measurement | Expanded Uncertainty (k=2) | | | |
|--|----------------------------|---------------|---------|--|
| | 0.15 MHz – 1 GHz | 1 GHz – 6 GHz | > 6 GHz | |
| RF Power and Power Density – antenna conducted | 1.1 dB | 1.5 dB | - | |
| Unwanted emissions - antenna conducted | 1.2 dB | 1.7 dB | 2.0 dB | |
| Bandwidth – antenna conducted | 50 Hz | 100 Hz | - | |
| Radiated emissions | 4.2 dB | 5.4 dI | 3 | |
| AC mains conducted emissions | 2.4 dB | - | - | |

EMC Report for Verifone, Inc. on the M445-403-01-NAA-4

File: 102971715MPK-003D Page 8 of 83

3.3 Justification

Preliminary testing was performed for all modulation/data rate modes. The following modes, in which the highest power was detected, were selected for final measurements:

OFDM, 6MB/s – for 802.11a OFDM, MCS0 – for 802.11n 20MHz OFDM, MCS0 – for 802.11n 40MHz

3.4 Mode of Operation During Test

During transmitter testing, the transmitter was setup to transmit continuously using the maximum RF power setting. Their corresponding output power in dBm can be found in section 4.2 of this report.

3.5 Modifications required for Compliance

Intertek installed no modifications during compliance testing in order to bring the product into compliance.

3.6 Additions, deviations and exclusions from standards

No additions, deviations or exclusion have been made from standard.

4.0 Measurement Results

4.1 Emission Bandwidth and 99% Occupied Bandwidth

15.407(a)(1)(2)

4.1.1 Procedure

The Procedure, described in the FCC Publication 789033 D02 General U-NII Test Procedures New Rules v01r04, was used. Specifically Section C for Emission Bandwidth and Minimum Emission Bandwidth for the band 5.725-5.850 GHz. Section D was used for 99% Occupied Bandwidth.

The antenna port of the EUT was connected to the input of a spectrum analyzer (SA). For each RF output channel investigated, the spectrum analyzer center frequency was set to the channel carrier.

The Occupied bandwidth was measured using the build-in spectrum analyzer facility for 99% power bandwidth measurement.

4.2 Maximum Conducted Output Power FCC Rule 15.407(a)(1)(iv)

4.2.1 Requirement

For mobile and portable client devices in the 5.15-5.25 GHz band, the maximum conducted output power over the frequency band of operation shall not exceed 250 mW provided the maximum antenna gain does not exceed 6 dBi. In addition, the maximum power spectral density shall not exceed 11 dBm in any 1 megahertz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

4.2.2 Procedure

The Procedure, described in the FCC Publication 789033 D02 General U-NII Test Procedures New Rules v01r04, was used. Specifically Section E (2) (c) Method SA-1 Alternative for Maximum Conducted Output Power

The antenna port output of the EUT was connected to the input of a spectrum analyzer to measure the Maximum Conducted Transmitter Output Power.

4.3 Peak Power Spectral Density FCC Rule 15.407(a)(1)(iv)

4.3.1 Requirement

For the band 5.725-5.85 GHz, the maximum conducted output power over the frequency band of operation shall not exceed 1 W. In addition, the maximum power spectral density shall not exceed 30 dBm in any 500-kHz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi. However, fixed point-to-point U-NII devices operating in this band may employ transmitting antennas with directional gain greater than 6 dBi without any corresponding reduction in transmitter conducted power. Fixed, point-to-point operations exclude the use of point-to-multipoint systems, omnidirectional applications, and multiple collocated transmitters transmitting the same information. The operator of the U-NII device, or if the equipment is professionally installed, the installer, is responsible for ensuring that systems employing high gain directional antennas are used exclusively for fixed, point-to-point operations.

4.3.2 Procedure

Each antenna port of the EUT was connected to the input of a spectrum analyzer to measure the Peak Power Spectral Density (PPSD) and recorded.

The Procedure, described in the FCC Publication 789033 D02 General U-NII Test Procedures New Rules v01r04, was used. Specifically procedure from Section F was utilized for Maximum Power Spectral Density (PSD).

4.4 Frequency stability FCC 15.407(g)

4.4.1 Requirement

Manufacturers of U-NII devices are responsible for ensuring frequency stability such that an emission is maintained within the band of operation under all conditions of normal operation as specified in the user's manual.

4.4.2 Procedure

The EUT was placed in a temperature chamber and setup to transmit. Procedures for frequency stability in ANSIC63.10:2013 section 6.8 was utilized.

The carrier frequency was measured with the spectrum analyzer with resolution bandwidth of 1 kHz. The temperature was varied from -20°C to 75°C, as stated in the user manual.

The radio module in this report is powered by 12.0VDC which was varied to 85% and 115% for testing. Testing was performed at a temperature of 20° C.

After the temperature stabilized for approximately 20 minutes, the transmitting frequency was measured.

4.5 Transmitter Radiated Emissions FCC Rule 15.407(b) (1-8) 15.209, 15.205

4.5.1 Requirement

- (b) Undesirable emission limits. Except as shown in paragraph (b) (7) of this section, the maximum emissions outside of the frequency bands of operation shall be attenuated in accordance with the following limits:
 - (1) For transmitters operating in the 5.15-5.25 GHz band: All emissions outside of the 5.15-5.35 GHz band shall not exceed an e.i.r.p. of -27 dBm/MHz.
 - (2) For transmitters operating in the 5.25-5.35 GHz band: All emissions outside of the 5.15-5.35 GHz band shall not exceed an e.i.r.p. of –27 dBm/MHz.
 - (3) For transmitters operating in the 5.47-5.725 GHz band: All emissions outside of the 5.47-5.725 GHz band shall not exceed an e.i.r.p. of −27 dBm/MHz.
 - (4) For transmitters operating in the 5.725-5.85 GHz band:
 - (i) All emissions shall be limited to a level of -27 dBm/MHz at 75 MHz or more above or below the band edge increasing linearly to 10 dBm/MHz at 25 MHz above or below the band edge, and from 25 MHz above or below the band edge increasing linearly to a level of 15.6 dBm/MHz at 5 MHz above or below the band edge, and from 5 MHz above or below the band edge increasing linearly to a level of 27 dBm/MHz at the band edge.
 - (5) The emission measurements shall be performed using a minimum resolution bandwidth of 1 MHz. A lower resolution bandwidth may be employed near the band edge, when necessary, provided the measured energy is integrated to show the total power over 1 MHz.
 - (6) Unwanted emissions below 1 GHz must comply with the general field strength limits set forth in §15.209. Further, any U-NII devices using an AC power line are required to comply also with the conducted limits set forth in §15.207.
 - (7) The provisions of §15.205 apply to intentional radiators operating under this section.
 - (8) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the upper and lower frequency band edges as the design of the equipment permits.

Emissions which fall in the restricted bands, as defined in §15.205(a), must comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

For transmitters operating in the 5.15–5.25 GHz band: all emissions outside of the 5.15–5.35 GHz band shall not exceed an EIRP of –27 dBm/MHz.

Out-of-band radiated emission complied with both the average and peak limits of Section 15.209 and an EIRP of -27 dBm/MHz (or 67.9dBuV at 3m)

File: 102971715MPK-003D Page 50 of 83

4.5.2 Procedure

Radiated emission measurements were performed from 30 MHz to 40 GHz according to the procedure described in ANSI C64.10. Spectrum Analyzer Resolution Bandwidth is 100 kHz or greater for frequencies 30 MHz to 1000 MHz, 1 MHz for frequencies above 1000 MHz. Above 1000 MHz Peak and Average measurements were performed.

The EUT is placed on a plastic turntable that is 80 cm in height for below 1000MHz and 1.5m in height for above 1GHz. If the EUT attaches to peripherals, they are connected and operational (as typical as possible). During testing, all cables were manipulated to produce worst-case emissions. The signal is maximized through rotation. The antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters.

Radiated emissions are taken at 3 meters for frequencies above 1 GHz and at 10 meters for frequencies below 1 GHz.

Measurements made from 30 MHz to 40 GHz were measured with 50 ohm terminator on the output of the EUT RF port. A preamp was used from 30MHz to 40GHz.

All measurements were made with a Peak Detector and compared to QP limits for 30 MHz - 1 GHz and Average limits for 1 GHz - 40 GHz.

EUT was positioned vertically and horizontally and emissions were measured. Data and pictures recorded below is the worst-case configuration (the configuration which resulted in the highest emission levels).

File: 102971715MPK-003D Page 51 of 83

4.5.3 Field Strength Calculation

Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

FS = RA + AF + CF - AG; if measurement is performed at a distance other than specified in the rule, a Distance Correction Factor (DCF) shall be added.

Where FS = Field Strength in $dB(\mu V/m)$ RA = Receiver Amplitude (including preamplifier) in $dB(\mu V)$; AF = Antenna Factor in dB(1/m)

CF = Cable Attenuation Factor in dB; AG = Amplifier Gain in dB

Assume a receiver reading of $52.0~dB(\mu V)$ is obtained. The antennas factor of 7.4~dB(1/m) and cable factor of 1.6~dB is added. The amplifier gain of 29 dB is subtracted, giving field strength of $32~dB(\mu V/m)$. This value in $dB(\mu V/m)$ was converted to its corresponding level in $\mu V/m$.

 $RA = 52.0 dB(\mu V)$ AF = 7.4 dB(1/m)

CF = 1.6 dB

CF = 1.0 ub

AG = 29.0 dB

 $FS = 52.0+7.4+1.6-29.0 = 32 dB(\mu V/m).$

Level in $\mu V/m$ = Common Antilogarithm [(32 dB $\mu V/m$)/20] = 39.8 $\mu V/m$.

File: 102971715MPK-003D Page 52 of 83

4.5.4 Antenna-port conducted measurements

Antenna-port conducted measurements may also be used as an alternative to radiated measurements for demonstrating compliance in the restricted frequency bands. If conducted measurements are performed, then proper impedance matching must be ensured and an additional radiated test for cabinet/case spurious emissions is required.

- 4.5.6 General Procedure for conducted measurements in restricted bands
- a) Measure the conducted output power (in dBm) using the detector specified for determining quasi-peak, peak, and average conducted output power, respectively.
- b) Add the maximum transmit antenna gain (in dBi) to the measured output power level to determine the EIRP level (see 12.2.5 for guidance on determining the applicable antenna gain)
- c) Add the appropriate maximum ground reflection factor to the EIRP level (6 dB for frequencies \leq 30 MHz, 4.7 dB for frequencies between 30 MHz and 1000 MHz, inclusive and 0 dB for frequencies > 1000 MHz).
- d) For devices with multiple antenna-ports, measure the power of each individual chain and sum the EIRP of all chains in linear terms (*e.g.*, Watts, mW).
- e) Convert the resultant EIRP level to an equivalent electric field strength using the following relationship:

E = EIRP - 20log D + 104.8

where:

 $E = electric field strength in dB\mu V/m$,

EIRP = equivalent isotropic radiated power in dBm

- D = specified measurement distance in meters.
- f) Compare the resultant electric field strength level to the applicable limit.
- g) Perform radiated spurious emission test

4.5.7 Test Results

The data on the following pages list the significant emission frequencies, the limit and the margin of compliance where emissions are within 3dB of the limit.

All conducted antenna port plots are corrected with the consideration of a 3.0 dBi Antenna Gain.

Radiated emission measurements were performed up to 40GHz. No Emissions were identified when scanned from 18-40 GHz.
