1. ATTESTATION OF TEST RESULTS

COMPANY NAME: PANERATECH, INC.
4125 Lafayette Drive, Suite 200
Chantilly, VA, 20151, USA

EUT DESCRIPTION: Ultra Wideband Asset Surveillance Sensor

MODEL: POLARIS

SERIAL NUMBER: 220001-A

SAMPLE RECEIPT DATE: 2023-03-13

DATE TESTED: 2023-03-13 to 2023-03-29

APPLICABLE STANDARDS	
STANDARD	TEST RESULTS
CFR 47 Part 15 Subpart F	Complies

UL LLC tested the above equipment in accordance with the requirements set forth in the above standards. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. All samples tested were in good operating condition throughout the entire test program. Measurement Uncertainties are published for informational purposes only and were not taken into account unless noted otherwise.

This document may not be altered or revised in any way unless done so by UL LLC and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL LLC will constitute fraud and shall nullify the document.

Approved & Released

2. TEST METHODOLOGY

The tests documented in this report were performed in accordance with FCC CFR 47 Part 2, FCC CFR 47 Part 15, FCC KDB 393764, ANSI C63.10-2013.

This report contains data provided by the customer which can impact the validity of results. UL LLC is only responsible for the validity of results after the integration of the data provided by the customer.

Below is a list of the data provided by the customer:

1. Antenna gain and type (see section 5.4)

3. FACILITIES AND ACCREDITATION

UL LLC is accredited by A2LA, certification # 0751.06, for all testing performed within the scope of this report. Testing was performed at the locations noted below.

	Address	ISED CABID	ISED Company Number	FCC Registration
☐	Building: 12 Laboratory Dr RTP, NC 27709, U.S.A	US0067	2180C	825374
☒	Building: 2800 Perimeter Park Dr. Suite B Morrisville, NC 27560, U.S.A		27265	

4. CALIBRATION AND UNCERTAINTY

4.1. MEASURING INSTRUMENT CALIBRATION

The measuring equipment utilized to perform the tests documented in this report has been calibrated in accordance with the manufacturer's recommendations, and is traceable to recognized national standards.

4.2. SAMPLE CALCULATION

RADIATED EMISSIONS

Where relevant, the following sample calculation is provided:

$$\begin{aligned} \text{Field Strength (dBuV/m)} &= \text{Measured Voltage (dBuV)} + \text{Antenna Factor (dB/m)} + \text{Cable} \\ &\text{Loss (dB)} - \text{Preamp Gain (dB)} \\ 36.5 \text{ dBuV} + 18.7 \text{ dB/m} + 0.6 \text{ dB} - 26.9 \text{ dB} &= 28.9 \text{ dBuV/m} \end{aligned}$$

MAINS CONDUCTED EMISSIONS

Where relevant, the following sample calculation is provided:

$$\begin{aligned} \text{Final Voltage (dBuV)} &= \text{Measured Voltage (dBuV)} + \text{Cable Loss (dB)} + \text{Limiter Factor} \\ &\text{(dB)} + \text{LISN Insertion Loss.} \\ 36.5 \text{ dBuV} + 0 \text{ dB} + 10.1 \text{ dB} + 0 \text{ dB} &= 46.6 \text{ dBuV} \end{aligned}$$

4.3. MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus:

PARAMETER	UNCERTAINTY
Conducted Disturbance, 0.15 to 30 MHz	3.4 dB
Radiated Disturbance, All ranges	6.0 dB
Radio Frequency (Spectrum Analyzer)	141.2 Hz
Occupied Channel Bandwidth	1.22%

Uncertainty figures are valid to a confidence level of 95%.

5. EQUIPMENT UNDER TEST

5.1. DESCRIPTION OF EUT

The EUT is an Ultra Wideband Asset Surveillance Sensor.

5.2. OPERATING FREQUENCY RANGE

The UWB radio operates over a nominal frequency range of 2000 to 8000 MHz. The measured UWB bandwidths of all channels lie within this range.

5.3. MAXIMUM OUTPUT POWER

The UWB transmitter has a maximum radiated output power as follows:

Max Pk Field Strength (dBuV/m)	Peak Output Power (dBm/MHz EIRP)	Peak Output Power (uW/MHz EIRP)
61.09	-34.11	0.388

The peak power was derived from a maximum field strength of:

$$61.09 \text{ dBuV/m} - 95.2 \text{ (3M)} = -34.11 \text{ dBm/MHz}$$

5.4. DESCRIPTION OF AVAILABLE ANTENNAS

The antenna(s) gain and type, as provided by the manufacturer' are as follows:

Antenna option 1: "RTS": Single custom TEM horn antenna, Max Gain: 9.3 dBi
Antenna option 2: "INS": Single custom TEM horn antenna, Max Gain: 11.3 dBi

5.5. SOFTWARE AND FIRMWARE

The firmware installed in the EUT during testing was Ver. 6070
The test utility software used during testing was XProbeCommunication, Ver. 1.4.6

5.6. WORST-CASE CONFIGURATION

The EUT was positioned in its intended orientation of operation with the antenna towards the Rx antenna as worst-case. The EUT can be configured with or without a switch box installed between the main control box and antenna. All testing performed with and without the switch box, with the exception of spurious emissions. This testing was performed with the switch box installed only as this is representative of the worst-case configuration.

5.7. DESCRIPTION OF TEST SETUP

7. UWB TEST PROCEDURES

All RF characteristics of the EUT are made using radiated measurements.

For Occupied Bandwidth, in order to capture the waveform, the EUT was placed on a non-reflective surface and pointed directly toward the Receive antenna. Due to the low amplitude of the transmit signal, the Receive antenna was moved as close as necessary to obtain a measureable signal.

For Radiated Emissions testing, the EUT was placed 80 cm above the ground reference plane for testing below 1 GHz and 150 cm above the ground reference plane for testing above 1 GHz. The EUT is set to transmit in a continuous mode.

For measurements below 960 MHz the antenna is located 3 meters from the EUT. The resolution bandwidth is set to 100 kHz for peak detection measurements or 120 kHz for quasi-peak detection measurements in the 30 to 960 MHz range, 9 kHz for peak and/or quasi-peak detection measurements in the 0.15 to 30 MHz range and 200 Hz for peak and/or quasi-peak detection measurements in the 9 kHz to 150kHz range. Peak detection is used unless otherwise noted as quasi-peak or average (9 kHz to 90 kHz and 110kHz to 490 kHz).

For 1 MHz RBW final measurements above 960 MHz the antenna is located no more than 3 meter from the EUT. The RBW and VBW are both set to 1 MHz. A R&S FSW signal analyzer with a true RMS detector is utilized.

A R&S FSW signal analyzer with a true RMS detector is utilized for measurements in the frequency ranges of 1164-1240 MHz and 1559-16160 MHz, the antenna is located 3 meters from the EUT. The RBW is set to 3 kHz and the VBW is set to 10 kHz.

The resulting 3 meter field strength is converted to EIRP using the equation $P \text{ (dBm EIRP)} = E \text{ (dBuV/m)} - 95.2$ per C63.10: 2013, Section 10.3.9.

Measurements used for calculating bandwidth, peak power, and the peak level of digital device emissions are made using peak detection.

8. LIMITS AND RESULTS

8.1. UWB BANDWIDTH, CENTER FREQUENCY, AND FRACTIONAL BW

DEFINITIONS AND LIMITS

§15.503 Definitions.

(a) UWB Bandwidth. For the purpose of this subpart, the UWB bandwidth is the frequency band bounded by the points that are 10 dB below the highest radiated emission, as based on the complete transmission system including the antenna. The upper boundary is designated f_H and the lower boundary is designated f_L . The frequency at which the highest radiated emission occurs is designated f_M .

(b) Center frequency. The center frequency, f_C , equals $(f_H + f_L)/2$.

(c) Fractional bandwidth. The fractional bandwidth equals $2(f_H - f_L)/(f_H + f_L)$.

(d) Ultra-wideband (UWB) transmitter. An intentional radiator that, at any point in time, has a fractional bandwidth equal to or greater than 0.20 or has a UWB bandwidth equal to or greater than 500 MHz, regardless of the fractional bandwidth.

§15.511 (a) The UWB bandwidth of an imaging system operating under the provisions of this section must be contained between 1990 MHz and 10,600 MHz.

TEST PROCEDURE

Radiated measurements are made using the procedures described above. The detection mode is set to peak detection, RBW/VBW = 1 MHz/3 MHz, the sweep time is AUTO, and the Max Hold trace function is utilized. The frequency range from 960 MHz to 10.6 GHz is measured.

The frequency at which the maximum EIRP is measured is designated as f_M . A major graticule line of the plot is adjusted to exactly equal the peak EIRP at f_M . The spectral envelope at the major graticule line that is 10 dB below the reference graticule is examined to determine the frequency band bounded by the points that are 10 dB below the highest radiated emission. The upper boundary is designated f_H and the lower boundary is designated f_L .

The center frequency, f_C , is calculated as $(f_H + f_L)/2$.

The RX antenna polarization that yields the highest EIRP at f_M is used to calculate the above parameters. In this case, the vertical polarity yielded the highest EIRP.

PLOT

8.2. PEAK POWER

LIMIT

§15.511 (e) There is a limit on the peak level of the emissions contained within a 50 MHz bandwidth centered on the frequency at which the highest radiated emission occurs, f_M . That limit is 0 dBm EIRP. It is acceptable to employ a different resolution bandwidth, and a correspondingly different peak emission limit, following the procedures described in § 15.521.

§15.521 (e) The frequency at which the highest radiated emission occurs, f_M , must be contained within the UWB bandwidth.

§15.521 (g) When a peak measurement is required, it is acceptable to use a resolution bandwidth other than the 50 MHz specified in this subpart. This resolution bandwidth shall not be lower than 1 MHz or greater than 50 MHz, and the measurement shall be centered on the frequency at which the highest radiated emission occurs, f_M . If a resolution bandwidth other than 50 MHz is employed, the peak EIRP limit shall be $20 \log (RBW/50)$ dBm where RBW is the resolution bandwidth in megahertz that is employed. This may be converted to a peak field strength level at 3 meters using $E(\text{dBuV/m}) = P(\text{dBm EIRP}) + 95.2$. If RBW is greater than 3 MHz, the application for certification filed with the Commission must contain a detailed description of the test procedure, calibration of the test setup, and the instrumentation employed in the testing.

TEST PROCEDURE

Radiated measurements are made using the procedures described above.

The spectrum analyzer center frequency is set to f_M . The RBW and VBW are both set to 50 MHz. The detector function is set to peak.

The instrumentation used is a R&S signal analyzer, model FSW50, which includes a standard RBW of 50 MHz. Thus, no correction to the limit is required and the E-field equivalent limit is defined as follows:

$$\text{Peak E-field (3m) } E(\text{dBuV/m}) = P(\text{dBm EIRP}) + 95.2 = 0 + 95.2 = 95.2 \text{ dBuV/m}$$

8.3. RADIATED EMISSIONS ABOVE 960 MHz

LIMITS

§15.511 (c) The radiated emissions at or below 960 MHz from a device operating under the provisions of this section shall not exceed the emission levels in § 15.209. The radiated emissions above 960 MHz from a device operating under the provisions of this section shall not exceed the following average limits when measured using a resolution bandwidth of 1 MHz:

Frequency in MHz	EIRP in dBm
960-1610	-53.3
1610-1990	-51.3
1990-10600	-41.3
Above 10600	-51.3

15.511 (d) In addition to the radiated emission limits specified in the table in paragraph (c) of this section, UWB transmitters operating under the provisions of this section shall not exceed the following average limits when measured using a resolution bandwidth of no less than 1 kHz:

Frequency in MHz	EIRP in dBm
1164-1240	-63.3
1559-1610	-63.3

§15.521 (d) Within the tables in §§15.509, 15.511, 15.513, 15.515, 15.517, and 15.519, the tighter emission limit applies at the band edges. Radiated emission levels above 960 MHz are based on RMS average measurements over a 1 MHz resolution bandwidth. The RMS average measurement is based on the use of a spectrum analyzer with a resolution bandwidth of 1 MHz, an RMS detector, and a 1 millisecond or less averaging time.

§15.521 (e) The frequency at which the highest radiated emission occurs, f_m , must be contained within the UWB bandwidth.

TEST PROCEDURE

Radiated measurements are made using the procedures described in ANSI C63.10: 2013 Section 10.3. The RBW/VBW = 1MHz/3MHz, the sweep time is set to 1mS/MHz, and the detector function is set to RMS average.

For the requirements of §15.511 (d), an RBW of 3 kHz is utilized in the 1164 to 1240 MHz and 1559-1610 MHz frequency range.

8.4. RADIATED EMISSIONS AT OR BELOW 960 MHz

LIMITS

§15.511 (c) The radiated emissions at or below 960 MHz from a device operating under the provisions of this section shall not exceed the emission levels in Section 15.209 of this chapter.

§15.209 (a) Except as provided elsewhere in this Subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)
0.009-0.490	2400/F(kHz)	300
0.490-1.705	24000/F(kHz)	30
1.705-30.0	30	30
30-88	100**	3
88-216	150**	3
216-960	200**	3
Above 960	500	3

** Except as provided in paragraph (g), fundamental emissions from intentional radiators operating under this Section shall not be located in the frequency bands 54-72 MHz, 76-88 MHz, 174-216 MHz or 470-806 MHz. However, operation within these frequency bands is permitted under other sections of this Part, e.g., Sections 15.231 and 15.241.

§15.209 (b) In the emission table above, the tighter limit applies at the band edges.

8.4.1. INS ANTENNA

SPURIOUS EMISSIONS 0.009 TO 30 MHz

Note: All measurements were made at a test distance of 3 m. The limits in the plots and tabular data are the FCC/IC limits extrapolated from the specification distance (300 m from 9-490 kHz and 30 m from 490 kHz – 30 MHz) to the measurement distance to clearly show the relative levels of fundamental and spurious emissions and demonstrate compliance with the requirement that the level of any spurious emissions be below the level of the intentionally transmitted signal. The extrapolation factor for the limits were 40*Log (specification distance / test distance).

Although these tests were performed at a test site other than an open area test site, adequate comparison measurements were confirmed against an open area test site. Therefore sufficient tests were made to demonstrate that the alternative site produces results that correlate with the ones of tests made in an open field based on KDB 937606

9. AC POWER LINE CONDUCTED EMISSIONS

LIMITS

FCC §15.207 (a)

Frequency of Emission (MHz)	Conducted Limit (dBuV)	
	Quasi-peak	Average
0.15-0.5	66 to 56 [*]	56 to 46 [*]
0.5-5	56	46
5-30	60	50

^{*} Decreases with the logarithm of the frequency.

TEST PROCEDURE

The EUT is placed on a non-conducting table 40 cm from the vertical ground plane and 80 cm above the horizontal ground plane. The EUT is configured in accordance with ANSI C63.10.

The receiver is set to a resolution bandwidth of 9 kHz. Peak detection is used unless otherwise noted as quasi-peak or average.

Line conducted data is recorded for both lines.
