Class II Permissive Change TEST REPORT

For

802.11b MiniPCI Type 3A Wireless Module Model Number: WM3A2100

MEASUREMENTS PERFORMED IN ACCORDANCE WITH THE FOLLOWING EMISSIONS STANDARD

47 CFR Part 15, Subpart C (Section 15.247)

Test Method:

ANSI C63.4: 1992 American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz

CERTIFICATE NUMBER: 1111.01

1.0 CERTIFICATION OF TEST DATA

Aegis Labs, Inc. operates as both a Nevada and California Corporation with no organizational or financial relationship with any company, institution, or private individual.

Testing and engineering functions provided by Aegis Labs are furnished through the use of part-time, full-time or consulting engineers with the appropriate qualifications to carry out their duties. The intended purpose of this test report is to describe the measurement procedure and to determine whether the equipment under test "EUT" complies with both the conducted and radiated limits. Limits for emissions testing are described under 47 CFR Part 15, Subpart C (Section 15.247).

The data, data evaluation and equipment configuration represented herein are a true and accurate representation of the Equipment Under Test (EUT) under the requirements specified in the emissions standard as described below. The test results contained in this report are only representative of the test sample tested as described in Section 2.0 of this report.

The test results provided within this report, indicate that the information technology equipment has been found to be in **COMPLIANCE** with the test specifications based upon the following RF compliance standards:

Pass/Fail determination is based upon the nominal values of the test data.

EMISSIONS STANDARDS	DESCRIPTION	TEST
		RESULTS
FCC 47 CFR, Part 15.207	Conducted Emissions At AC Mains Port	PASSED
CISPR22 Class B Limits	Radiated Emissions (30-1000 MHz)	PASSED
FCC 47 CFR, Part 15.247(c), 15.209	Radiated Emissions (1-26.5 GHz)	PASSED
FCC 47 CFR, Part 15.247(a)(2)	Occupied Bandwidth Measurement	PASSED
FCC 47 CFR, Part 15.247(b)	Maximum Peak Output Power Measurement	PASSED

2.0 ADMINISTRATIVE DATA AND TEST DESCRIPTION

DEVICE TESTED: Trade Name: 802.11b MiniPCI Type 3A Wireless Module

Model Number: WM3A2100 Serial Number: 000423468079

FCC ID: E2K24CLNS

TEST DATE(S): March 28-April 3, 2003

DATE EUT RECEIVED: March 28, 2003

ORIGIN OF TEST

SAMPLE(S): Production

RESPONSIBLE PARTY: Dell Computer Corporation

One Dell Way

Round Rock, TX 78682

CLIENT CONTACT: Mr. Jason Limoges

MANUFACTURER: Dell Computer Corporation

TEST LOCATION: Aegis Labs, Inc.

32231 Trabuco Creek Road Trabuco Canyon, CA 92678

Conducted Site #2 Radiated Site #2

A2LA CERTIFICATE: 1111.01, Valid until February 28, 2004

PURPOSE OF TEST: To demonstrate compliance with the relevant standards described

in Section 1.0 of this report.

TEST(S) PERFORMED: Refer to Table in Section 1 of this report.

All calibration vendors were responsible for certifying Aegis Labs, Inc. test equipment as per the manufacturer's specifications and that the equipment is calibrated using instruments and standards where the accuracy is traceable to the National Institute of Standards and Technology (NIST). Calibration of all test equipment conforms to ANSI/NCSL Z540-1 and ISO 10012-1 and/or ISO/IEC Guide 17025 compliance (Additionally, other pertinent test equipment will carry MIL-STD-45662A). All calibration documents are on file with Aegis Labs, Inc., with copies provided upon request.

3.0 DESCRIPTION OF EUT

3.1 EUT Description

Equipment Under Test (EUT)				
Trade Name:	802.11b MiniPCI Type 3A Wireless Module			
Model Number:	WM3A2100			
Frequency Range:	2.412 – 2.462 GHz			
Type of Transmission:	Direct Sequence Spread Spectrum			
Transfer Rate: 1/2/5.5/11 Mbps				
Number of Channels:	11			
Modulation Type:	DBPSK, DQPSK, CCK			
Antenna Type:	Wistron NeWeb Corp. Triple-Band PIFA Antenna Type			
Antenna Gain (See Note 2):	Main = 2.59dBi (gain) -1.13dB (loss) = 1.46dBi Auxiliary = 0.82dBi (gain) - 1.29dB (loss) = -0.47dBi			
Transmit Output Power: 16 dBm (Typical) Please see Appendix I (Data Shee actual output power.				
Power Supply: 3.3VDC from computer MPCI slot.				
Number of External Test Ports Exercised:	2 Antenna Ports (1 Main & 1 Auxiliary)			

The 802.11b MiniPCI Type 3A Wireless Module is an embedded 2.4 GHz Wireless Local Area Network Mini-PCI adapter. The Mini-PCI Type 3A form factor is designed for notebook computer systems where overall thickness must be kept to an absolute minimum. It is capable of a data rate of up to 11 Mbps at 2.4 GHz. Please refer to Section 3.2 of this report for a further description of the configuration tested.

NOTE 1: For a more detailed description, please refer to the manufacture's specifications or User's Manual.

NOTE 2: Refer to the antenna specifications for a further description of the antennas.

3.1.1 Channel Number and Frequencies

Eleven channels are provided for the EUT.

Channel	Frequency (MHz)
1	2412
2	2417
3	2422
4	2427
5	2432
6	2437
7	2442
8	2447
9	2452
10	2457
11	2462

3.2 EUT Configuration

The EUT was set-up according to the ANSI C63.4: 1992 guidelines for emissions testing. For emissions testing the EUT (802.11b MiniPCI Type 3A Wireless Module, Model Number: WM3A2100) had a loaded antenna connected to both its main and auxiliary ports. All the appropriate test ports were exercised during both the pre-qualification and final evaluation scans.

The EUT was tested connected to a set of Winstron NeWeb Corporation PIFA type antennas via its main and auxiliary Hirose U.FL-R-SMT antenna ports installed in the Mini-PCI slot of the Dell Computer Corporation host laptop computer. Data can be found in Appendix I.

The Dell Computer Corporation host laptop computer was connected to a Canon printer and NEC monitor via its parallel and video ports respectively.

The low (channel 1), middle (channel 6), and high (channel 11) were tested. The EUT was transmitting and receiving on a continuous basis.

The final data was taken in this mode of operation. The external cables were bundled and routed as shown in the photographs in Appendix I (Data Sheets).

3.3 EUT and Sub-Assemblies List

EUT and Sub-Assemblies List							
Manufacturer	Equipment Name	Model Number	Serial Number				
Intel Corporation	802.11b MiniPCI Type 3A	WM3A2100	000423468079				
	Wireless Module						
Sub-Assemblies							
Wistron NeWeb	Main Antenna (Metal PIFA)	CAB-A	None				
Corporation							
Wistron NeWeb	Auxiliary Antenna (Metal PIFA)	CAB-A	None				
Corporation							

3.4 Accessory / Host Equipment List

Accessory / Host Equipment List							
Manufacturer Equipment Name Model Number Serial Number							
Latitude D400 Laptop	Dell	PPT Chassis	8142Y010093232601052M000				
AC Adapter	Dell	HP-OQ065B83	CN-05U092-47890-31D-0049				
Monitor	NEC	JC-1575VMA	2Y785821				
Modem	Hayes	5362US	A02153623145				

NOTE: All the power cords of the above support equipment are standard non-shielded, 1.8 meters long.

3.5 Cabling Diagram and Description

- Cable 1: This is a 6-foot braid and foil shielded round cable connecting the host Dell Computer laptop computer with the NEC monitor. It has metallic DB-15 type connector at the computer end and is hardwired to the monitor. The cable is bundled to a length of one meter and the shield of the cable is grounded to the chassis of both devices via the connector shells.
- Cable 2: This is a 6-foot braid and foil shielded round cable connecting the Dell Computer host computer to the Hayes modem. It has a metallic DB-9 type connector at the computer end and a metallic DB-25 type connector at the modem end. The cable is bundled to a length of one meter and the shield of the cable is grounded to the chassis of both devices via the connector shells.

4.0 TEST EQUIPMENT AND TEST SETUPS

The test equipment settings and functions are selected using the guidance of ANSI C63.4-1992. All test equipment setups and operations during conducted and radiated emissions testing are in accordance with this reference document.

4.1 Conducted Emissions At AC Mains Port

During conducted emissions measurements, a spectrum analyzer was used as the measuring instrument along with a preselector and quasi-peak detector. A 10 dB attenuation pad was used for the protection of the spectrum analyzer input stage. The conducted emissions from the EUT in the frequency range from 150 kHz to 30 MHz were captured for graphical display through the use of automated LABVIEW EMI measurement software. All graphical readings were measured in the "Peak" mode only to reduce testing time. Upon completion of the graphical scan, the test lab personnel performed the conducted measurement scan manually using the spectrum analyzer front panel keys. All peak measurements coming within 3 dB of the limit line were "Averaged" and/or "Quasi-Peaked" and denoted appropriately in the EXCEL spreadsheet.

The Equipment Under Test (EUT) was configured as a system with peripherals connected, so that at least one interface port of each type is connected to one external peripheral when tested for conducted emissions according to ANSI C63.4: 1992. The EUT was tested in a tabletop configuration.

The six highest emission readings for Line 1 and Line 2 are highlighted on the data sheets in Appendix I. The graphical scans only reflects peak readings while the tabulated data sheets reflect peak, average, and/or quasi-peak readings which ever applies.

Conducted Emissions At AC Mains Port – Test Setup 4.1.1

Page 11 of 19

Report Number: INTEL-030328F FCC ID: E2K24CLNS

CONDUCTED EMISSIONS TEST SETUP

4.2 Spurious Radiated Emissions

A spectrum analyzer was used as the measuring instrumentation along with a preselector and quasi-peak-detector. The pre-amplifiers were used to increase the sensitivity of the instrument. The spectrum analyzer was used in the peak detector mode with the "max-hold" feature activated and in Positive Peak mode. In this mode, the spectrum analyzer records the highest measured reading over all the sweeps. The quasi-peak detector was used only for those readings, which are marked accordingly in the data sheet. The effective measurement bandwidth used for the radiated emissions test was 120 kHz for (30 MHz- 1000 MHz). The spectrum analyzer operated such that the modulation of the signal was filtered out to set the analyzer in linear mode. For testing beyond 1000 MHz a spectrum analyzer capable of taking reading above 1000 MHz was connected to the high frequency amplifier, where these measurement readings were taken with the transducer placed at a 3-meter test distance from the EUT.

The Open Area Test Sites (OATS) was used for radiated emission testing. These test sites are designed according to ANSI C63.4: 1992 and ANSI C63.7: 1992 guidelines. The Measurements were conducted in accordance with ANSI C63.4: 1992 and ANSI C63.7: 1992 requirements.

Broadband biconical, log periodic, and horn antennas were used as transducers during the measurement reading phase. The frequency spans were wide (30 MHz-88 MHz, 88 MHz-216 MHz, 216 MHz-300 MHz, and 300 MHz-1000 MHz). After 1000 MHz the horn antenna was used to measure emissions. The six highest emission readings in both horizontal and vertical polarities are highlighted on the data sheets in Appendix I.

4.2.1 Spurious Radiated Emissions – Test Setup

Page 13 of 19 Report Number: INTEL-030328F FCC ID: E2K24CLNS

4.3 Maximum Peak Output Power Measurement

A power meter along with a power sensor was used to measure the maximum peak output power. The low (channel 1), middle (channel 6), and high (channel 11) were measured as well as data rates 1, 5.5, and 11 Mbps.

The EUT maximum peak output power is less than 1 Watt. Please refer to Appendix I for the data sheets.

4.3.1 Maximum Peak Output Power Measurement – Test Setup

4.4 Occupied Bandwidth Measurement

A spectrum analyzer was used to measure the occupied bandwidth. The bandwidth was measured using a direct connection from the RF output port of the EUT to the spectrum analyzer using a low loss cable and a DC block. The resolution bandwidth was 100 kHz and the video bandwidth was 300 kHz.

The EUT bandwidth is at least 500 kHz. Please refer to Appendix I for graphical plots.

4.4.1 Occupied Bandwidth Measurement – Test Setup

4.5 Spectral Power Density Measurement

A spectrum analyzer was used to measure the spectral power density. It was measured using a direct connection from the RF output port of the EUT to the spectrum analyzer using a low loss cable and a DC block. The resolution bandwidth was 3 kHz and the video bandwidth was 10 kHz. The highest 4.5 MHz of the signal was used as the frequency span with the sweep rate being 1 second for every 3 kHz of span.

The EUT spectral power density does not exceed 8 dBm in any 3 kHz band. Please refer to Appendix I for graphical plots.

4.5.1 Spectral Power Density Measurement – Test Setup

4.6 Spurious Emissions Measurement At The Antenna Terminal

A spectrum analyzer was used to measure the spurious emissions at the antenna terminal. It was measured using a direct connection from the RF output port of the EUT to the spectrum analyzer using a low loss cable and a DC block. The resolution bandwidth was 100 kHz and the video bandwidth was 300 kHz. The spans were wide enough to include all the harmonics and emissions that were produced by the intentional radiator.

The EUT RF power that is produced in any 100 kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator is at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. Please refer to Appendix I for graphical plots.

4.6.1 Spurious Emissions Measurement At The Antenna Terminal – Test Setup

4.7 Band Edge Measurement At The Antenna Terminal

A spectrum analyzer was used to measure the band edge measurements at the antenna terminal with the EUT transmitting at 2412 MHz (channel 1) and 2462 MHz (channel 11). It was measured using a direct connection from the RF output port of the EUT to the spectrum analyzer using a low loss cable and a DC block. The resolution bandwidth was 1 MHz and the video bandwidth was 1 MHz. It was verified that the band edge measurements were not above the limit in the restricted bands below 2390 MHz and above 2483.5 MHz. Please refer to Appendix I for graphical plots.

4.7.1 Band Edge Measurement At The Antenna Terminal – Test Setup

5.0 MODIFICATIONS AND RECOMMENDATIONS

There were no modifications done to the EUT.

BAND EDGE EMISSIONS MEASUREMENT AT THE ANTENNA TERMINAL

CLIENT:	Dell Computer Corporation	DATE:	03/28/03
EUT:	802.11b MiniPCI Type 3A Wireless	PROJECT	INTEL-030328-08
	Module	NUMBER:	
MODEL NUMBER:	WM3A2100	TEST ENGINEER:	Rick Candelas
SERIAL NUMBER:	000423468079	SITE #:	2
CONFIGURATION:	Installed in Dell Computer	TEMPERATURE:	21 C
	Corporation laptop computer (PPT	HUMIDITY:	27% RH
	Chassis).	TIME:	1:30 PM

Standard:	FCC CFR 47, Part 15, 15.247(c)
Description:	Conducted Band Edge Emissions
Results:	In any 100 kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement.

TEST RESULTS SUMMARY			
Data	Result		
Channel 1 Band Edge Measurement	>20 dBc – Pass		
Peak Measurement @ 2390 MHz			
Channel 1 Band Edge Measurement	55.04 dBuV - Pass		
Average Measurement @ 2390 MHz			
Channel 11 Band Edge Measurement	>20 dBc – Pass		
Peak Measurement @ 2483.5 MHz			
Channel 11 Band Edge Measurement	56.78 dBuV - Pass		
Average Measurement @ 2483.5 MHz
