## 2.2. Description of Support Units

The EUT has been tested as an independent unit together with other necessary accessories or support units. The following support units or accessories were used to form a representative test configuration during the tests.

Equipment	Model No.	Serial No.	FCC ID	Trade Name
/		L	1	1
Mater				

Note:

- 1. All the equipment/cables were placed in the worst-case configuration to maximize the emission during the test.
- 2. Grounding was established in accordance with the manufacturer's requirements and conditions for the intended use.
- 3. For conducted measurements (Output Power, 20dB Occupied Bandwidth, Carrier Frequencies Separation, Hopping Channel Number, Dwell Time, Spurious Emissions), the antenna of EUT is connected to the test equipment via temporary antenna connector, the antenna connector is soldered on the antenna port of EUT, and the temporary antenna connector is listed in the Test Instruments.

#### Test Results and Measurement Data 4.

According to §1.1307(b), systems operating under the provisions of this section shall be operated in a manner that ensure that the public is not exposed to radio frequency energy level in excess of the Commission's guideline.

Remark: 1) For BLE: The maximum output power for antenna is 4.30dBm (2.69mW) at 2480MHz, 2.31dBi antenna gain(with 1.70 numeric antenna gain.) For 2.4G WIFI: The maximum output power for antenna is 13.15dBm (20.65mW) at 2462MHz, 2.31dBi antenna gain(with 1.70 numeric antenna gain.) **For 5G WIFI:** The maximum output power for antenna is 14.63dBm (29.04mW) at 5755MHz, 2.28dBi antenna gain(with 1.69 numeric antenna gain.) 2) For mobile or fixed location transmitters, no SAR consideration applied. The minimum separation generally be used is at least 20cm, even if the calculation indicate that the MPE distance would be lesser.

#### Calculation

Ε

Given

$$= \sqrt{\frac{30 \times P \times G}{d}} \quad \& \quad S = \frac{E^2}{3770}$$

Where E = Field Strength in Volts / meter P = Power in WattsG=Numeric antenna gain d=Distance in meters S=Power Density in milliwatts / square centimeter

 $r^2$ 

Substituting the MPE safe distance using d=20cm into above equation. S=0.000199\*P\*G Yields:

Mode	Power(mW)	numeric antenna gain	Power density (mW/cm²)	Limit (mW/cm²)	Result
BLE	2.69	1.70	0.000910		
2.4G WIFI	20.65	1.70	0.006986	1.0	PASS
5G WIFI	29.04	1.69	0.009766
