FCC Part 15 Subpart E §15.407 IC RSS-247 Issue 2

FCC ID: TQ8-DA330SKAN IC Certification: 5074A-DA330SKKN

Equipment Under Test : DISPLAY CAR SYSTEM

Model Name : FCC: DA330SKAN

Variant Model Name(s) : -

Applicant : Hyundai Mobis Co., Ltd.

Manufacturer : Hyundai Mobis Co., Ltd.

Date of Receipt : 2020.11.18

Date of Test(s) : 2020.11.26 ~ 2021.01.05

Date of Issue : 2021.01.28

In the configuration tested, the EUT complied with the standards specified above. This test report does not assure KOLAS accreditation.

1) The results of this test report are effective only to the items tested.

2) The SGS Korea is not responsible for the sampling, the results of this test report apply to the sample as received.

# 2. DFS (Dynamic Frequency Selection)

# 2.1. System Overview

### 2.1.1. Set up of EUT

The radar signal generation equipment consists of a vector signal generator

The signal monitoring equipment consists of a spectrum analyzer set to display 8 001 bins on the horizontal axis. The time domain resolution is 2 msec/bin with a 16 second sweep time, meeting the 10 second short pulse reporting criteria. The aggregate ON time is calculated by multiplying the number of bins above a threshold during a particular observation period by the dwell time per bin, with the analyzer set to peak detection and max hold.

The Slave is tested separately for compliance with the Channel Shutdown requirements, for the situation when the Slave device vacates the channel in response to detection of a radar by the Master.

All tests were performed at a channel center frequency of 5 290 \( \mathbb{M} \) and 5 530 \( \mathbb{M} \). Measurements were performed using conducted test methods.

#### 2.2. Limit

§15.407(h) and FCC 06-96 APPENDIX "COMPLIANCE MEASUREMENT PROCEDURES FOR UNLICENSED-NATIONAL INFORMATION INFRASTRUCTURE DEVCIES OPERATING IN THE 5 250-5 350 Mb AND 5 470-5 725 Mb BANDS INCORPORATING DYNAMIC FREQUENCY SELECTION

RSS-247 Issue 2, 6.3 AND FCC 06-96 APPENDIX "COMPLIANCE MEASUREMENT PROCEDURES FOR UNLICENSED-NATIONAL INFORMATION INFRASTRUCTURE DEVCIES OPERATING IN THE 5 250-5 350 Mbz AND 5 470-5 725 Mbz BANDS INCORPORATING DYNAMIC FREQUENCY SELECTION"

Industry Canada requires the use of either the FCC KDB Procedure 905462 or the procedure in the ETSI EN 301 893 for demonstrating compliance with the DFS radar detection requirements set out in this section.

Report Number: F690501-RF-RTL001621 Page: 8 of 15

Additional requirement for devices with multiple bandwidth modes	Master Device or Client with Radar Detection	Client Without Rader Detection
U-NII Detection Bandwidth and Statistical Performance Check	All BT modes must be tested	Not required
Channel Move Time and Channel Closing Transmission Time	Test using widest BT mode available	Test using the widest BW mode available for the link
All other tests	Any single BW mode	Not required

Note: Frequencies selected for statistical performance check (Section 7.8.4) should include several frequencies within the radar detection bandwidth and frequencies near the edge of the radar detection bandwidth. For 802.11 devices it is suggested to select frequencies in each of the bonded 20 MHz channels and the channel center frequency.

Table 3: DFS Detection Thresholds for Master Devices and Client Devices with Radar Detection

Maximum Transmit Power	Value (See Note 1, 2, and 3)	
EIRP ≥ 200 milliwatt	- <b>64</b> dB <b>m</b>	
EIRP < 200 milliwatt and	-62 dB m	
power spectral density < 10 dB m/MHz	-02 db III	
EIRP < 200 milliwatt that do not meet the power spectral	-64 dB m	
density requirement	0 1 ab III	

Note 1: This is the level at the input of the receiver assuming a 0 dB i receive antenna.

**Note 2:** Throughout these test procedures an additional 1 dB has been added to the amplitude of the test transmission waveforms to account for variations in measurement equipment. This will ensure that the test signal is at or above the detection threshold level to trigger a DFS response.

**Note 3:** EIRP is based on the highest antenna gain. For MIMO devices refer to KDB Publication 662911 D01.

#### KDB 905462 D03 Client without DFS New Rules v01r02: UNII client devices without radar detection

- The guidance provided in Section 8 (DFS Test Report Guidelines) in the appropriate DFS Test Procedure specified in KDB Publication 905462 D02.
- · Test results demonstrating an associated client link is established with the master on a test frequency; if a client device operates in a "listen only" mode to a master without formally "associating" with it the test report must include tests for such modes.
- · The devices must be tested with a master device operating in the same band and operation modes.
- · If two client devices can communicate directly with each other while maintaining an association with a master or if the client operates on a frequency band while "listening" to a master, such modes must be tested with the master device active.
- The client and DFS-certified master device are associated, and a movie can be streamed as specified in the DFS Order for a non-occupancy period test.
- · The test frequency has been monitored to ensure no transmission of any type has occurred for 30 minutes. Note: If the client moves with the master, the device is considered compliant if nothing appears in the client non-occupancy period test. For devices that shut down (rather than moving channels), no beacons should appear.
- · An analyzer plot that contains a single 30-minute sweep on the original channel.

**Table 4: DFS Response Requirement Values** 

Parameter	Value	
Non-occupancy period	Minimum 30 minutes	
Channel Availability Check Time	60 seconds	
Channel Move Time	10 seconds See Note 1.	
	200 milliseconds + an aggregate of 60	
Channel Closing Transmission Time	milliseconds over remaining 10 second period.	
	See Notes 1 and 2.	
U-NII Detection Bandwidth	Minimum 100 % of the U-NII 99 % transmission	
O-Mil Detection Bandwidth	power bandwidth. See Note 3.	

**Note 1:** Channel Move Time and the Channel Closing Transmission Time should be performed with Radar Type 0. The measurement timing begins at the end of the Radar Type 0 burst.

**Note 2:** The Channel Closing Transmission Time is comprised of 200 milliseconds starting at the beginning of the Channel Move Time plus any additional intermittent control signals required to facililate a Channel move (an aggregate of 60 milliseconds) during the remainder of the 10 second period. The aggregate duration of control signals will not count quiet periods in between transmissions.

**Note 3:** During the U-NII Detection Bandwidth detection test, radar type 0 should be used. For each frequency step the minimum percentage of detection is 90 percent. Measurements are performed with no data traffic.

# 2.3. Description of EUT

The EUT operates over the band 2A "5 260 Mb ~ 5 320 Mb (11a/n\_HT20, 11ac\_VHT20), 5 270 Mb ~ 5 310 Mb (11n\_HT40, 11ac\_VHT40), 5 290 Mb (11ac\_VHT80)" and band 2C "5 500 Mb ~ 5 720 Mb (11a/n\_HT20, 11ac\_VHT20), 5 510 Mb ~ 5 710 Mb (11n\_HT40, 11ac\_VHT40), 5 530 Mb ~ 5 690 Mb (11ac\_VHT80)" ranges.

The rated output power of the client unit is < 200 milliwatt.

Therefore the required interference threshold level is -62 dB m.

The reference maker is set after 200 ms from the end of Last radar pulse.

The delta is set at the end of the last WLAN transmission following the radar pulse. This delta is the channel move time within the 10 sec form the end of Last radar pulse.

The aggregate channel closing transmission time is calculated as follows:

Aggregate Transmission Time = (Number of analyzer bins showing transmission)\*(dwell time per bin)

The observation period over which the aggregated time is calculated begins at (Reference Maker) and ends no earlier than (Reference Maker +10 sec)
