## Maintaining the Computer

Use this chapter to solve problems you may encounter and perform routine maintenance on your CN3 Mobile Computer:

## **Upgrading the Operating System on your CN3 Computer**

You can use the *Intermec Recovery Tools CD* to reinstall or upgrade the operating system software on the CN3 Computer. For more information, contact your Intermec representative for more information about this CD.

You can use the SmartSystems<sup>™</sup> Foundation application from Intermec to perform upgrades on your CN3 Computer, versions 2.0 or later. Contact your Intermec representative for more information about the SmartSystems Foundation software.

When you upgrade the operating system, you erase the current configuration and replace it with the new default configuration. You will need to reset the network parameters on the CN3 Computer to reestablish communications with other devices in the network. In other words, if you upgrade the operating system and the default registry from the operating system has changed, the registry is rolled back to the new default.

## **Troubleshooting Your CN3 Computer**

- Problems While Operating the CN3 Computer (page 92)
- Problems While Configuring the CN3 Computer (page 93)
- Problems While Configuring 802.1x Security (page 94)
- Problems with Wireless Connectivity (page 93)
- Problems While Scanning Bar Codes (page 95)

Before sending the CN3 Computer in for service, save its data and configuration. Intermec is responsible only for the keypad and hardware features to match the original configuration when doing repairs or replacements.

#### **Problems While Operating the CN3 Computer**

Problem	Solution
You press % to turn on the CN3 Computer and nothing happens.	Make sure the backlight is on by pressing .  Make sure you have a charged CN3 Battery installed correctly. For help, see "Using the Batteries" on page 7.  The battery may be discharged. Replace the battery with a spare charged battery, or charge the battery. Perform a clean-boot.
The Battery status LED is on.	If the battery status LED is a steady green, the battery is more than 95% charged and unit is on a charger. If the battery status LED is blinking red, then the battery is low.  If the battery status LED is a steady red, the main battery is on charge.

#### **Problems While Operating the CN3 Computer (continued)**

Problem	Solution
The CN3 Computer appears to be locked up and you cannot enter data.	Press % to turn off the CN3 Computer, then press % again to turn on the CN3 Computer.  Press and hold % for ten seconds to clean-boot the CN3 Computer.  Try reloading the firmware. See "Updating the System Software" on page 73.  If the CN3 Computer does not boot or reset, contact your local Intermec representative for help.

#### **Problems While Configuring the CN3 Computer**

Problem	Solution
You scan a configuration command, such as Beeper Volume, and you hear three low beeps.	If you are working in the Intermec Settings applet, you cannot scan configuration commands. Exit the applet to scan configuration commands.
You scan or enter an option for the Scanner Model configuration command and you hear three low beeps.	You may have scanned or entered a Scanner Model command that does not apply to the type of scanner that you have installed. Try scanning or entering the Scanner Model command again and select an option for the type of device you are using.
You cannot type a character on the keypad or you can only type uppercase or lowercase letters.	You may have locked a modifier key on the keypad. Check the CN3 toolbar to see if it contains an icon with a locked symbol. Press the necessary key sequence to unlock the key. See "Using the Keypad" on page 11.

#### **Problems with Wireless Connectivity**

Problem	Solution
When you turn on the CN3 Computer after it was suspended for a while (10-15 minutes or longer), it can no longer send or receive messages over the network.	Host may have deactivated or lost current terminal emulation session. In a TCP/IP direct connect network, turn off the "KeepAlive" message from host to maintain the TCP session while a CN3 Computer is suspended.
The No Network Connection icon appears on the toolbar. The CN3 Computer is not communicating with the access point.	CN3 Computer is not connected to access point. Ensure access point is turned on and operating. Move closer to access point to reestablish communications. Ensure CN3 Computer is configured correctly for network. CN3 radio parameters must match all access point values (see page 113).  If you have an 802.11b/g radio and its radio initialization process failed, reset the CN3 Computer (see page 3). If No Network Connection icon still appears, you may have a defective radio card. For help, contact your local Intermec representative.

#### **Problems with Wireless Connectivity (continued)**

Problem	Solution
The CN3 Computer is connected to the Intermec Application Server or host computer and you move to a new site to collect data. The <b>Network Connection</b> icon was visible, but is now replaced with the <b>No Network Connection</b> icon.	Move closer to an access point or to a different location to reestablish communications until the <b>Network Connection</b> icon appears. Any data you collected while out of range is transmitted over the network.
The <b>Network Connection</b> icon is in the toolbar, but you cannot establish a terminal emulation session with the host computer.	There may be a problem with the host computer, with the connection between the Intermec Application Server and the host computer, or with the connection between the access point and the host computer. Check with network administrator to make sure the host is running and allowing users to login to the system.
The Network Connection icon is in the toolbar, but the host computer is not receiving any data from the CN3 Computer.	In a UDP Plus network, there may be a problem with the connection between the Intermec Application Server and the host computer. Check with network administrator or see the user's manual for the Intermec Application Server. In a TCP/IP network, there may be a problem with the connection between the access point and the host computer. Check with network administrator or use your access point user's manual.

#### **Problems While Configuring 802.1x Security**

If you have trouble configuring the computer for 802.1x security, check these problems and possible solutions.

Problem	Solution
The CN3 Computer indicates that it is authenticated, but it does not communicate with the host.	Ensure CN3 IP address, host IP address, subnet mask, default router are configured for network.
The CN3 Computer does not appear to be authenticating and a network connection icon does not appear on the toolbar.	CN3 Computer may not be communicating with access point. Ensure CN3 network name matches access point network name (SSID).  802.1x security network may not be active. Ensure the server software is properly loaded and configured on server PC. For help, see server software documentation.

Problem	Solution
A network connection icon appears in the toolbar, but then disappears.	CN3 Computer may not be communicating with the intended access point. Ensure the CN3 network name matches the access point network name. Default network name is "INTERMEC."  Access point may not be communicating with server. Ensure the access point is turned on, properly configured, and has 802.1x security enabled.
The CN3 Computer indicates it is not authenticated.	User Name and Password parameters on CN3 Computer must match the user name and password on authentication server. You may need to reenter the password on both CN3 Computer and authentication server.  On your authentication server, the user and group are allowed and the group policy is allowed to log into the server. For help, see the documentation that shipped with your authentication server software.  IP address and secret key for access point must match the IP address and secret key on authentication server. You may need to reenter the IP address and secret key on both your access point and authentication server.  Authentication server software is running on server PC
You are setting up multiple access points in a network, with different SSIDs, and the connection fails.	CN3 Computer does not save WEP key values when changing the SSID. Reenter the WEP key value after changing the SSID, select <b>Apply Network Settings</b> from the 802.11 Radio menu. You should now be able to connect to the different access points.
You receive a message saying "The server certificate has expired or your system date is incorrect" after you perform a clean-boot on the CN3 Computer.	Date and time are not saved when a clean-boot is performed. Reenter the date and time, then select <b>Apply Network Settings</b> from the 802.11 Radio menu.

## **Problems While Scanning Bar Codes**

Problem	Solution
You cannot see a red beam of light from the scanner when you press the <b>Scan</b> button and aim the scanner at a bar code label.	You may be too far away from the bar code label. Try moving closer to the bar code label and scan it again. You may be scanning the bar code label "straight on." Change the scanning angle and try again. Move within 2 feet of a wall to test the effective scan of the scanner. For help scanning bar codes, see <b>page 4</b> .
When you release the Scan button or handle trigger, the Good Read light does not turn off.	The Good Read light will remain on if you configure the CN3 Computer to use continuous/edge triggering. If you configure the CN3 Computer for level triggering and the Good Read light remains on, there may be a problem. Press the Scan button or pull the trigger again without scanning a bar code label. If the light is still on, contact your local Intermec representative.

#### Chapter 4 — Maintaining the Computer

## **Problems While Scanning Bar Codes (continued)**

Problem	Solution
The input device attached to the CN3 Computer does not work well or read bar code labels very quickly.	Set the Scanner Model command to the specific attached input device. Check enabled bar code symbologies and enable only the symbologies being used.
The scanner will not read the bar code label.	Aim the scanner beam to cross entire bar code label in one pass. Vary the scanning angle.  Check the quality of the bar code label, Scan a bar code label that you know will scan. Compare the two bar code labels to see if the bar code quality is too low. You may need to replace the label that you cannot scan.  Ensure the bar code symbology is enabled. Use the Intermec Settings applet to check the symbologies. Expand Data Collection > Symbologies beneath devices listed (scanner, virtual wedge) to check and enable symbologies, then scan the bar code label again.  Ensure the CN3 application is expecting input from a bar code. You may need to type this information instead.
The scanner does not read the bar code labels quickly, or the scanning beam seems to be faint or obscured.	The scanner window may be dirty. Clean the window with a solution of ammonia and water. Wipe dry. Do not allow abrasive material to touch the window.
You scan a valid bar code label to enter data for your application. The data decoded by the scan module does not match the data encoded in the bar code label.	CN3 Computer may have decoded the bar code label in a symbology other than the label's actual symbology. Try scanning the bar code label again. Make sure you scan the entire label.
You receive a message reading "Scanner Communication Failure" when trying to connect a 1551E or 1553 decoded scanner.	Make sure you are using the correct cable.  Make sure the scanner cable is attached correctly. When you attach the scanner to the port, it should emit a single power up beep.  Try enabling the port state using the Intermec Settings applet.  Try upgrading the scanner firmware.  Select ASCII as the scanner model.
Your 1551E or 1553 scanner was working fine, but after changing the port setting you cannot change the configuration.	1551E or 1553 scanner port must use the correct RS-232 settings to allow configuration in the Intermec Settings applet. Disable, then enable the scanner port state.
Configuration settings in the Intermec Settings applet do not match the settings on your 1551E or 1553 Scanner.	Disable, then enable the scanner port state to synchronize the CN3 Computer settings with the scanner.

## **Cleaning the Scanner and Camera Windows and Screen**

To keep the CN3 Computer in good working order, you may need to clean the EA11 scanner and color camera windows and the screen.

Clean the scanner and camera windows and screen as often as needed for the environment in which you are using the CN3 Computer. To clean the CN3 Computer, use a solution of ammonia and water.

There are no user-serviceable parts inside the CN3 Computer. Opening the unit will void the warranty and may cause damage to the internal components.

Press % to turn off the CN3 Computer. Dip a clean towel or rag in the ammonia solution and wring out the excess. Wipe off the scanner and camera windows and screen. Do not allow any abrasive material to touch these surfaces. Wipe dry.

**CN3 Computer with EA11 Scanner** 

**CN3 Computer with Color Camera** 

Chapter 4 — Maintaining the Computer

# **5** Network Support

This chapter includes information about the different networks supported by the CN3 Mobile Computer, and ways to configure and manage those networks. Note that the CN3 Computer automatically installs the appropriate software for radio or phone use when the unit is turned on.

Note: Desktop icons and applet icons are shown to the left. Any place that **Start** is mentioned, tap the following Windows icon in the top, left corner of your CN3 desktop.

#### **Personal Area Networks**

"Bluetooth" is the name given to a technology standard using short-range radio links, intended to replace cables connecting portable and fixed electronic devices. The standard defines a uniform structure for a range of devices to communicate with each other with minimal user effort. Its key features are robustness, low complexity, low power, and low cost. The technology offers wireless access to LANs, the mobile phone network, and the internet for a host of home appliances and mobile computer interfaces.

Wireless Printing can also be done with Microsoft APIs, including Bluetooth extensions for Winsock, and Bluetooth virtual COM ports. Information about other Bluetooth software is in the Bluetooth Resource Kit and the *Bluetooth Resource Kit User's Guide* via the Intermec Developer Library (IDL), which is available as a download from the Intermec web via <a href="https://www.intermec.com/idl">www.intermec.com/idl</a>. See your Intermec representative for information.

Bluetooth is not started by default after a clean-boot is performed. You can turn on Bluetooth doing either of the following:

#### **Wireless Manager**

You can use the Wireless Manager to enable and disable Bluetooth, Wi-Fi, and the Phone if it is built into your CN3 Computer.

To enable Bluetooth using the Wireless Manager, tap **Start** > **Settings** > the **Connections** tab > the **Wireless Manager** icon, or tap the Wireless Manager row from the Today desktop.

In the Wireless Manager, either tap **All** or tap **Bluetooth**, then wait for "On" to appear beneath the **Bluetooth** row.

Tap **Menu** > **Bluetooth Settings** to do device discovery (more information on the next page). Tap **Done** to close the Wireless Manager.

#### **Bluetooth**

Bluetooth is not started by default after a clean-boot is performed. To run Bluetooth, tap **Start** > **Settings** > the **Connections** tab > the **Bluetooth** icon.

The CN3 Computer retains the Bluetooth state when clean-boots are performed, for example:

- *If Bluetooth is enabled*, and a clean-boot was performed, the CN3 Computer boots up with the Bluetooth state enabled and Bluetooth virtual COM ports (such as printing) registered. Reactivate the connections manually as the system does not do them.
- *If Bluetooth is disabled*, and a clean-boot was performed, the CN3 Computer boots up with Bluetooth disabled.

#### Mode

To turn on Bluetooth, select **Start** > **Settings** > the **Connections** tab > the **Bluetooth** icon > the **Mode** tab. Check **Turn on Bluetooth**, check **Make** this device visible to other devices, then click ok.

#### **Devices**

Use this tab to scan for other Bluetooth devices.

1 Tap Add new device... to discover (or scan) remote Bluetooth devices.

**2** When the CN3 Computer is finished scanning, any newly discovered devices appear in the box. Tap **Refresh** to do additional discoveries.

**3** Select a device to which to connect, then click **Next**.

**4** Enter a passkey to establish a secure connection, then tap **Next**. Tap **Yes** if prompted to let the other device connect with your CN3 Computer.

**5** Select what services you want from this remote device, then click **Finish** to return to the **Devices** tab.

#### **COM Ports**

Use this page to connect to other devices or allow other devices to connect with your CN3 Computer.

1 Tap New Outgoing Port to connection to a Bluetooth device, select the device to add, then click Next.

**2** Select a port from the **Port** drop-down list, check **Secure Connection**, then click **Finish** to return to the COM Ports page.

**3** Tap New Incoming Port to allow other Bluetooth devices to connect with your CN3 Computer, select on which port to secure this connection, then click Finish to return to the COM Ports page.

**4** You can press and hold on a device to either edit that device or delete it from the list.

#### **Wireless Printing**

The Wireless Printing applet separates the task of wireless printing from other Bluetooth management items not relevant to this task.

Wireless Printing has a concept of the "current wireless printer." This printer is the one to which the CN3 Computer makes a connection when the wireless printing COM port is opened. If there is no current wireless printer, there is no wireless printing COM port. Registration and deregistration of this COM port is controlled by the Bluetooth COM port control. Use the Wireless Printing applet to handle the COM port registration. Customer software or other test applications can also use this applet to manage the COM port registration and deregistration.

The current wireless printer is stored in the registry and is registered and deregistered on Bluetooth stack load/unload. If the current wireless printer changes, the existing wireless printing COM port is deregistered, and the new one is registered instead. The registered COM port is stored in the registry as the "WPort."

For information on using Bluetooth communications, see the Bluetooth Resource Kit in the IDL, which is available as a download from the Intermec web site at www.intermec.com/idl. Contact your Intermec representative for more information.

Use any of the following methods to set the wireless printer:

- Use a Bluetooth device discovery to locate the remote device (page 105)
- Manually enter the remote Bluetooth Device Address (page 106)
- Use the Current Wireless Printer screen to set a different printer (page 107)

#### Search

To do a Bluetooth device discovery, do the following:.

- 1 Select Start > Settings > the System tab > the Wireless Printing icon.
- **2** Clear the **Show Printers Only** box if you want to discover more than just the Bluetooth printers. Tap **Search** to initiate the device discovery.

**3** In about half a minute, Bluetooth devices discovered within your range will appear. If your preferred printer is in the list, select to highlight the printer, then tap **OK**.

If you do not see your preferred device, make sure this device is powered on and set to discovery, then tap **Search** again. Tap **Cancel** to return to the first screen without making changes.

#### Manual

If you know the Bluetooth Device Address of the printer you want to use, do the following to avoid Device Discovery and perform a manual setup.

1 Select Start > Settings > the System tab > the Wireless Printing icon.

**2** Tap **Manual**, enter the address of your device in the field, then tap **OK**. Tap **Cancel** to return to the first screen without making changes.

When you set your printer manually, your device may not receive the printer name. Therefore, "-unknown-" can display under **Device Name** unless you enter the correct value in to the registry in some other way.

#### Set Different Printer

To change your printer, do the following:

1 Select Start > Settings > the System tab > the Wireless Printing icon.

**2** Tap **Set Different Printer** to return to the device discovery screen.

**3** Tap either **Search** or **Manual**, tap **OK**., then do the applicable steps. Tap Cancel to the current wireless printer settings without making changes, then tap **Exit** to close the applet.

#### **Bluetooth Audio**

Use this to discover, activate, and connect to Bluetooth audio devices, such as Bluetooth headsets. You can select a desired audio mode or control the Bluetooth audio volume and microphone gain for the connected Bluetooth headset (if the connected headset has these capabilities).

> From the CN3 desktop, select **Start** > **Settings** > the **System** tab > the **Blue**tooth Audio icon to access the Bluetooth Audio applet.

#### **Discovering Bluetooth Headsets**

To discover a Bluetooth headset with either a "headset" or a "hands-free" profile, tap **Search for devices**. Discovered audio devices are added to the list with an icon to identify either profile.

#### **Connecting to a Bluetooth Headset**

Note: You can only select one Bluetooth audio device.

1 Tap a Bluetooth audio device from the list of discovered devices. When a pop-up menu appears and if the device selected was not authenticated during the discovery process, select **Authenticate** to continue.

**2** Tap the device name, then select **Connect** from the pop-up menu. On successful device activation, the device icon changes to remove the red bar from the left connection image.

- Tap the Volume slider bar to adjust the volume of the connected Bluetooth audio device.
- Tap the Microphone slider bar to adjust the microphone gain of the connected Bluetooth audio device.
- 3 If the activated device has a "hands-free" profile, press a button on the device to establish an audio connection between the CN3 and the activated device. See the user manual for the Bluetooth device for information on what button to press.
- **4** To establish an audio connection from the CN3 Computer to the activated device with either a "headset" or "hands-free" profile, tap the device name, then select Connect from the menu. When connection is established, the "connected/disconnected" status changes to that of a "connected" status.

#### **Configuring Bluetooth Using Intermec Settings**

You can also configure your Bluetooth communications using the Intermec Settings applet. From the CN3 desktop, select Start > Settings > the Sys-Intermed tem tab > the Intermed Settings icon. Tap to expand (+) Communications, then **Bluetooth** to configure its settings.

#### **Connecting with Bluetooth**

**Note**: While these instructions apply to many Bluetooth devices, these instructions use the Nokia 3650 for example purposes.

Make sure Bluetooth is enabled on your mobile phone. For example, with the Nokia 3650, go to its menu, select **Connect** > **Bluetooth**, then set **My phone's visibility** to "Shown to all."

Before you connect to the network, make sure Bluetooth is enabled on your CN3 Computer so you can discover and connect to remote devices. Go to "Personal Area Networks" on page 100 for information.

Do the following to establish a Bluetooth connection between your CN3 Computer and your mobile phone, then establishing a dial-up networking session with your wireless network. Once connected, you should be able to browse Internet websites and use other online resources.

1 Tap Start > Settings > the Connections tab > the Connections icon, then tap Add a new modem connection.

2 Enter a name for the connection, such as "Nokia." In the Select a modem list, select "Bluetooth," then tap Next to continue.

**3** Tap **Add new device...** if the phone is not listed in the known devices. Make sure your Bluetooth device is turned on before you start the search.

**4** When the discovery of devices is complete, select your Bluetooth device, then tap **Next** to continue.

**5** Enter the correct **Passkey** on both the Bluetooth device and the CN3 Computer, then tap **Next** to continue.

**6** Enter a name for the device if needed, or select what services to use, then tap **Finish**.

**7** Select the Bluetooth device to use to connect to the network, then tap **Next** to continue.

**8** Enter the appropriate number as it should be dialed for your Bluetooth connection, then tap **Next** to continue.

**9** Enter the user name, password, and domain required for your Bluetooth device, then tap **Finish.** 

Now you can establish a connection to your network via the Internet Explorer application. To disconnect, tap the Connectivity icon in the top menu bar, then select **Disconnect**.

## **Local Area Networks**

The CN3 Computer is a versatile mobile computer that you can add to your wired or wireless data collection network. You can connect your CN3 Computer to your network using either the 802.11b/g radio or the Bluetooth radio.

#### Configuring 802.11b/g Radio Communications

The wireless CN3 Computer has an internal 802.11b/g radio to transfer data using wireless communications. This section of the manual assumes that you have already set up your wireless communications network including access points. If you are using a UDP Plus network, you also need to have an Intermec Application Server communicating with a host computer.

Your CN3 Computer supports TCP/IP and UDP Plus network protocols. The easiest way to configure the network parameters on the CN3 Computer is to use the Intermec Settings applet. See "Intermec Settings Applet" on page 10 for more information.

#### Configuring the Network Parameters for a TCP/IP Network

In a TCP/IP network, the CN3 Computer communicates with a host computer directly using TCP/IP. The access point acts as a bridge to allow communications between the wired and wireless networks.

#### Configuring the Network Parameters for a UDP Plus Network

In a UDP Plus network, the CN3 Computer communications with a host computer through the Intermec Application Server. The Intermec Application Server translates UDP Plus packets on the wireless network into TCP/IP packets on the wired network and vice versa. The access point acts as a bridge to allow communications between wired and wireless networks.

## **Phone Application** (GPRS/GSM Radios)

With the WAN radio module installed in your CN3 Computer, you can send and receive telephone calls within your Wi-Fi range.

Use the speaker on the back of the computer as your earpiece and use the connector on the bottom of the computer for your mouthpiece.

Tap **Start** > **Settings** > the **Phone** desktop icon from the **Personal** tab or tap **Start** > **Phone** to access the application which processes your phone calls. Tap the **Close** button in the upper right corner of this application to close.

#### **Activation**

At factory-default, the phone is disabled. To turn on the phone, use either of the following methods:

#### **Wireless Manager**

You can use the Wireless Manager to enable and disable Bluetooth, Wi-Fi, and the Phone if it is built into your CN3 Computer.

To turn on the phone using the Wireless Manager, tap **Start** > **Settings** > the **Connections** tab > the **Wireless Manager** icon, or tap the Wireless Manager row from the Today desktop.

In the Wireless Manager, either tap **All** or tap **Phone**, then wait for "On" to appear beneath the **Phone** row.

Tap **Menu** > **Phone Settings** to configure the phone (more information on the next page). Tap **Done** to close the Wireless Manager.

#### **Phone Application**

Tap the appropriate keys to enter a telephone number, then tap **Talk** to dial the number.

#### **Call History**

Tap Call History to note the telephone numbers that were previously dialed from this CN3 Computer.

#### **Speed Dial**

Tap **Speed Dial** to select a telephone number with which the CN3 Computer is to dial automatically. To add to this list, use the Contacts application. See "Contacts: Tracking Friends and Colleagues" on page 48 for

more information about the Contacts application.

#### **Tools**

Tap **Tools** > **Send SMS** tab to access the Inbox application and send an SMS (Short Messaging Service) message. Be sure to have an SMS number ready to send the message — this is usually the mobile phone number. See "Messaging: Sending and Receiving E-mail Messages" on page 56 for information about Messaging.

#### **Phone Settings**

Either select **Tools** > **Options** from the Phone application or select **Start** > **Settings** > the **Personal** tab > the **Phone** icon to access the applet.

• Tap the **Phone** tab to customize your phone settings such as the ring type and ring tone to use for incoming calls, and the keypad tone to use when entering phone numbers. Tap **Other Settings** to go to the Sounds

& Notifications applet.

• Tap the Services tab to access settings for any of the provided services.

Tap any of the settings, then tap **Get Settings**. Make your changes, then tap **ok** to return to the Settings screen. Below is a sample Settings screen.

Tap the **Network** tab to find, set, or select the type of network on which this phone is to communicate.

## Remote Access (Modems)

You can set up connections to the Internet and corporate network at work to browse the Internet or intranet, send and receive e-mail, and synchronize information using ActiveSync. Connections are made via wireless networks.

Your CN3 Computer has two groups of connection settings: My ISP and My Work Network. Use My ISP settings to connect to the Internet. Use My Work Network settings to connect to any private network.

 My ISP: Once connected, you can send and receive e-mail messages by using Messaging and view Web or WAP pages by using Internet Explorer Mobile. The communication software for creating an ISP connection is already installed on your CN3 Computer. Your service provider provides the software needed to install other services, such as paging and fax services. If this is the method you want to use, see "Connecting to an Internet Service Provider" on page 119.

My Work Network: Connect to the network at your company or organization where you work. Once connected, you can send and receive email messages by using Messaging, view Web or WAP pages by using Internet Explorer Mobile, and synchronize with your desktop. If this is the method you want to use, see "Connecting to Work" on page 121.

## **Connecting to an Internet Service Provider**

You can connect to your ISP, and use the connection to send and receive e-mail messages and view Web or WAP pages.

Get an ISP dial-up access telephone number, a user name, and a password from your ISP.

To view additional information for any screen in the wizard or while changing settings, tap the **Help** icon.

1 Tap Start > Settings > the Connections icon. In My ISP, tap Add a new modem connection.

**2** Enter a name for the connection, such as "ISP Connection."

If using an external modem connected to your CN3 Computer with a cable, select "Hayes Compatible on COM1" from the **Select a modem** 

**list** drop-down, then tap **Next** to continue.

**3** Enter the access phone number, then tap **Next**. For more information, tap **use dialing rules**.

**4** Enter the user name, password, and domain (if provided by an ISP or your network administrator), then tap **Finish**.

**5** Tap the **Advanced** tab from the Connections screen, then tap **Dialing Rules** to specify your current location. These settings apply to all con-

nections. Tap Use dialing rules, tap ok, then tap Edit to continue.

**6** Specify your current phone type. If your phone type is pulse dialing, check **Pulse dialing**. If your type is tone dialing (as most phone lines are), then clear **Pulse dialing**. Continue to tap **ok** to close each page and return to the Settings page.

To start the connection, start using one of the following programs. Once connected, you can:

- Send and receive e-mail messages by using Messaging. Before you can use Messaging, you need to provide the information it needs to communicate with the e-mail server.
- Visit Web and WAP pages by using Internet Explorer Mobile. For more information, see "Internet Explorer Mobile" on page 66.

Note: To change modem connection settings in My ISP, tap Manage existing connections. Select the desired modem connection, tap Settings, then follow the instructions on the screen.

#### **Connecting to Work**

If you have access to a network at work, you can send e-mail messages, view intranet pages, synchronize your CN3 Computer, and possibly access the Internet. Create a modem connection via a RAS (Remote Access Server) account. Before you can create this modem connection, your network

administrator needs to set up a RAS account for you. Your network administrator may also give you Virtual Private Network (VPN) settings.

Note: To change modem connection settings in My Work Network, tap Manage existing connections. Select the desired modem connection, tap Settings, then follow the instructions on the screen.

To view additional information for any screen in the wizard or while changing settings, tap the **Help** icon.

1 Tap Start > Settings > the Connections icon. In My Work Network, tap Add a new modem connection.

- 2 Enter a name for the connection, such as "Company Connection." In the Select a modem list, select your modem type, then tap Next to continue. If your modem type does not appear, try reinserting your CN3 Computer into your modem dock.
  - If using an external modem connected to your CN3 Computer with a cable, select "Hayes Compatible on COM1."
  - If using any type of external modem, select the modem by name. If a listing does not exist for your external modem, select "Hayes Compatible on COM1."

**3** Enter the access phone number, using some of the following guidelines. If you know part of the phone number changes frequently as you travel,

create dialing rules to avoid creating numerous modem connections for the same phone number. For more information, tap use dialing rules.

- Enter the phone number exactly as you want it dialed. For example, if you call from a business complex or hotel that requires a nine before dialing out, enter "9" in front of the phone number.
- Enter the APN provided by your mobile phone service provider.
- When using dialing rules, phone numbers are entered differently. To use additional numbers, such as a "9" to dial from an office complex or hotel, you must use additional dialing rules or change dialing patterns. See "Create Dialing Rules" via your online help for information.
- **a** In Country/Region code, enter the appropriate code when dialing internationally. For more information, contact an operator at your local phone company.
- **b** In Area code, enter the area code, if needed.
- c Enter the Phone Number, then tap Next to continue.

**4** Enter the user name, password, and domain (if provided by an ISP or your network administrator). If a domain name was not provided, try the connection without entering a domain name. Tap **Finish**.

#### **Creating a VPN Server Connection to Work**

A VPN connection helps you to securely connect to servers, such as a corporate network, via the Internet. Ask your network administrator for the following: user name, password, domain name, TCP/IP settings, and host name or IP address of the VPN server

To view additional information for any screen in the wizard or while changing settings, tap the **Help** icon.

Note: To change existings in My Work Network, tap Manage existing connections > the VPN tab. Select the desired VPN connection, tap Settings, then follow the instructions on the screen.

1 Tap Start > Settings > the Connections icon. In My Work Network, tap Add a new VPN server connection.

2 In Name, enter a name for the connection, such as a company's name.

In **Host name/ IP**, enter the VPN server name or IP address.

Next to **VPN type**, select the type of authentication to use with your device: "IPSec/L2TP" or "PPTP." If you are not sure which option to choose, ask your network administrator. Tap **Next** to continue.

**3** Select the type of authentication. If you select **A pre-shared key**, enter the key provided by your network administrator.

**4** Enter your user name, password, and domain name as provided by your ISP or network administrator, then tap **Finish**. If a domain name was not provided, try the connection without entering a domain name.

Insert necessary equipment, such as a network card, into the CN3 Computer, and use a desired program to begin connecting.

## **Ending a Connection**

- When connected via modem or VPN, tap the **Connectivity** icon on the top, then tap **Disconnect**.
- When connected via cable or cradle, detach your CN3 Computer.
- When connected via Infrared, move the CN3 Computer away from the other computer or device.
- When connected via a wireless network, switch off the connection.

#### **iConnect**

The default network adapter or radio is dependent on what radios are installed in your CN3 Computer. With the iConnect menu, using the **Enable** feature, you can specify "Wireless" or "No Networking" to load onto your CN3 Computer when a cold-boot is performed.

If you had specified a network prior to when a warm-boot is performed on the CN3 Computer, the iConnect application restores your network interfaces to what they were before the warm-boot was performed.

See the Developer's Support area of the Intermec web site for the latest information on network adapters for your unit.

To access the iConnect menu, tap the iConnect icon (shown to the left) above your command bar for the following menu:

Select **Dismiss** from the iConnect menu to end the session without exiting the application.

Select Exit iConnect to exit the application. To access the iConnect application after you have exited it, perform a warm-boot on the CN3 Computer. The iConnect icon then reappears above the command bar.

### No Networking

If you do not need any networking interface, select Enable > No Networking from the iConnect menu. The Wireless radio tower icon is replaced with one that shows an "X," a check mark appears next to the "No Networking" option in the menu, and the iConnect application disables all other networking interfaces.

#### **Wireless Communications**

To enable wireless communications on the CN3 Computer, select **Enable** > **Wireless** from the iConnect menu. The **Wireless** icon (shaped like a radio tower) appears in the toolbar, a check mark appears next to the "Wireless" option in the menu, and wireless communications is enabled.

To configure wireless communications on the CN3 Computer, select **Tools > Wireless Settings** from the iConnect menu to access the Profile Wizard for the 802.11b/g radio module.

You can configure wireless 802.11b/g communications through the applet. Tap Start > Settings > the System tab > the Wireless Network icon to access the Profile Wizard. Go to "Configuring Microsoft Security" on page 148 for information.

To view information about the Wireless 802.11b/g communications, select **Tools > Wireless IP Settings** from the iConnect menu for the following:

To view the status of the Wireless communications, select **Status > Wireless** from the iConnect menu to view the status. Tap **Try Again** to check the status after you make changes to the connection.

# **Ping Test**

Select **Tools** > **Ping Test** from the iConnect menu to test the connection of your CN3 Computer against your network. If you want to ping your gateway or DHCP server, select **Ping my gateway or DHCP server**, then select which to ping from the top drop-down list. If you want to ping a specific host, select **Ping the host address below**, then enter its IP address in the field beneath. After you make your selection, tap **Ping!** and wait for results.

# **Configuring Security**

Use the next sections to understand how to configure each type of security on your wireless CN3 Computer.

The CN3 Computer provides three types of security for your wireless network: Wi-Fi Protected Access 2 (WPA2/802.11i), WPA, and WEP. 802.1x should be referred to as an authentication method used for WPA and WPA2. Another authentication method for WPA and WPA2 would be the Pre-Shared Key (PSK).

By default, Funk security is enabled. You must use either Microsoft or Funk security to implement your security solution. Go to page 130 for more information.

# **Loading Certificates**

If you choose to use Transport Layer Security (TLS) with WPA or 802.1x security, you need to have a unique client certificate on the CN3 Computer and a trusted root certificate authority (CA) certificate. If you choose to use PEAP, you need to load a root CA certificate. You can use a third-party CA to issue unique client certificates and a root certificate.

If your CA is on your WLAN, select **Start > Settings >** the **System** tab > the **Certificates** icon > the **Root** tab to view certificate details. To remove a certificate, press and hold a certificate, then select **Delete**.

# **Wireless Network**

Your wireless adapter (network interface card) connects to wireless networks of two types: infrastructure networks and ad-hoc networks.

- Infrastructure networks get you onto your corporate network and the internet. Using the 802.11b/g infrastructure mode, the CN3 Computer establishes a wireless connection to an access point, linking you to the rest of the network.
- Ad-hoc networks are private networks shared between two or more clients, even with no access point.

Each wireless network is assigned a name (or Service Set Identifier - SSID) to allow multiple networks to exist in the same area without infringement.

Intermec recommends using security measures with wireless networks to prevent unauthorized access to your network and to ensure your privacy of transmitted data. Authentication (cryptographically protected) by both the network and the user, transmitted data, and encryption are required elements for secure networks. There are schemes available for implementing these features.

# **Encryption**

AES (Advanced Encryption Standard)	A block cipher, a type of symmetric key cipher that uses groups of bits of a fixed length - called blocks. A symmetric key cipher is a cipher using the same key for both encryption and decryption.  As implemented for wireless, this is also known as CCMP, which implements AES as TKIP and WEP are implementations of RC4.
CKIP (Cisco Key Integrity Protocol)	This is Cisco's version of the TKIP protocol, compatible with Cisco Aironet products.
TKIP (Temporal Key Integrity Protocol)	This protocol is part of the IEEE 802.11i encryption standard for wireless LANs., which provides per-packet key mixing, a message integrity check and a re-keying mechanism, thus overcoming most of the weak points of WEP. This encryption is more difficult to crack than the standard WEP. Weak points of WEP include: No Initiation Vector (IV) reuse protection, weak keys, no protection against message replay, no detection of message tampering, and no key updates.
WEP (Wired Equivalent Privacy) encryption	With preconfigured WEP, both the client CN3 Computer and access point are assigned the same key, which can encrypt all data between the two devices. WEP keys also authenticate the CN3 Computer to the access point - unless the CN3 Computer can prove it knows the WEP key, it is not allowed onto the network. WEP keys are only needed if they are expected by your clients. There are two types available: 64-bit (5-character strings, 12345) (default) and 128-bit (13-character strings, 1234567890123). Enter these as either ASCII (12345) or Hex (0x31323333435).

# **Key Management Protocols**

WPA (Wi-Fi Protected Access)	This is an enhanced version of WEP that does not rely on a static, shared key. It encompasses a number of security enhancements over WEP, including improved data encryption via TKIP and 802.11b/g authentication with EAP. WiFi Alliance security standard is designed to work with existing 802.11 products and to offer forward compatibility with 802.11i.
WPA2 (Wi-Fi Protected Access)	Second generation of WPA security. Like WPA, WPA2 provides enterprise and home Wi-Fi users with a high level of assurance that their data remains protected and that only authorized users can access their wireless networks. WPA2 is based on the final IEEE 802.11i amendment to the 802.11 standard ratified in June 2004. WPA2 uses the Advanced Encryption Standard (AES) for data encryption and is eligible for FIPS (Federal Information Processing Standards) 140-2 compliance.

#### **Authentication**

EAP (Extensible Authentication Protocol)	802.11b/g uses this protocol to perform authentication. This is not necessarily an authentication mechanism, but is a common framework for transporting actual authentication protocols. Intermec provides a number of EAP protocols for you to choose the best for your network.
EAP-FAST (Flexible Authentication via Secure Tunneling)	A publicly accessible IEEE 802.1X EAP type developed by Cisco Systems. It is available as an IETF informational draft. An 802.1X EAP type that does not require digital certificates, supports a variety of user and password database types, supports password expiration and change, and is flexible, easy to deploy, and easy to manage.
LEAP (Lightweight Extensible Authentication Protocol)	Also known as Cisco-Wireless EAP, provides username/password based authentication between a wireless client and a RADIUS server. In the 802.1x framework, traffic cannot pass through a wireless network access point until it successfully authenticates itself.
EAP-PEAP (Protected Extensible Authentication Protocol)	Performs secure authentication against Windows domains and directory services. It is comparable to EAP-TTLS both in its method of operation and its security, though not as flexible. This does not support the range of inside-the-tunnel authentication methods supported by EAP-TTLS. Microsoft and Cisco both support this protocol.
EAP-TLS (Transport Layer Security)	Based on the TLS (Transport Layer Security) protocol widely used to secure web sites. This requires both the user and authentication server have certificates for mutual authentication. While cryptically strong, this requires corporations that deploy this to maintain a certificate infrastructure for all their users.
EAP-TTLS (Tunneled Transport Layer Security)	This protocol provides authentication like EAP-TLS (see page 141) but does not require certificates for every user. Instead, authentication servers are issued certificates. User authentication is done using a password or other credentials that are transported in a securely encrypted "tunnel" established using server certificates.  EAP-TTLS works by creating a secure, encrypted tunnel through which you present your credentials to the authentication server. Thus, inside EAP-TTLS there is another <i>inner authentication protocol</i> that you must configure via Additional TTLS Settings.

# **Choosing Between Microsoft and Funk Security**

Before you can implement a security solution on the CN3 Computer, you need to choose between Microsoft and Funk security:

- By default, Funk security is enabled. It provides everything you get with Microsoft security plus the addition of Cisco Compatible Extensions features. It also provides additional authentication types like EAP-TTLS, LEAP, and EAP-FAST. If you want to use Funk security, you can starting configuring your security now. Information starts on the next page.
- If you want to use Microsoft security, you need to select Microsoft security as your security choice before you can do configurations. Go to "Configuring Microsoft Security" on page 148 to begin.

**Note**: Your security choice does not depend on your authentication server. For example, you can choose Funk security if you use Microsoft Active Directory\* to issue certificates.

# **Configuring Funk Security**

You can define up to four profiles for your Funk Odyssey security. Different profiles let your CN3 Computer communicate in different networks without having to change all of your security settings. For example, you can set up one profile for the manufacturing floor and one for the warehouse.

- 1 Select Start > Settings > the System tab > the Intermec Settings icon.
- 2 Tap (+) to expand Communications > 802.11 Radio > Funk Security.
- **3** Select an active profile, then configure its security settings.

# **Using WPA Security**

Wi-Fi Protected Access (WPA) is a strongly enhanced, interoperable Wi-Fi security that addresses many of the vulnerabilities of Wired Equivalent Privacy (WEP). Instead of WEP, WPA uses Temporal Key Integrity Protocol (TKIP) for its data encryption method. Currently, WPA satisfies IEEE 802.11i standards.

WPA runs in Enterprise (802.1x) mode or PSK mode:

- In Enterprise mode, WPA provides user authentication using 802.1x and the Extensible Authentication Protocol (EAP). That is, an authentication server (such as a RADIUS server) must authenticate each device before the device can communicate with the wireless network.
- In PSK mode, WPA provides user authentication using a shared key between the authenticator and the CN3 Computer. WPA-PSK is a good solution for small offices or home offices that do not want to use an authentication server.

To use WPA security, you need an access point with an 802.11b/g radio that supports WPA.

### **Configuring WPA Security With Funk Security**

Use this procedure to set WPA security with Funk security.

- 1 Make sure you have configured the communications and radio parameters on your CN3 Computer and that Funk is your security choice.
- 2 Open Intermec Settings. Tap (+) to expand Communications > 802.11 Radio > Funk Security > Profile X with "X" being "1" through "4."
- **3** For Association, select "WPA" and press Enter.
- **4** For **8021x**, select "PEAP," "TLS," "TTLS," "LEAP," or "EAP-FAST" and press **Enter**.

If you select "TTLS" or "PEAP:"

- **a** Select User Name, type your user name, then press Enter.
- **b** Select User Password, type a user password, then press Enter.
- c For Validate Server Certificate, select "Yes," then press Enter. Note that you must have the date on the CN3 Computer set correctly when you enable Validate Server Certificate.
- **d** You must enter a User Name and Subject Name. You can also enter a Server 1 Common name or Server 2 Common name if you want to increase your level of security.

If you select "TLS:"

- **a** Load a user and root certificate on your CN3 Computer. For help, see "Loading Certificates" on page 128.
- **b** For Validate Server Certificate, select "Yes," then press Enter. Note that you must have the date on the CN3 Computer set correctly when you enable Validate Server Certificate.
- c You must enter a User Name and Subject Name. You can also enter a Server 1 Common name or Server 2 Common name if you want to increase your level of security.

If you select "LEAP" or "EAP-FAST:"

- **a** Select **User Name**, type your user name, then press **Enter**.
- **b** Select User Password, type a user password, then press Enter.
- **6** Exit the Intermec Settings applet.

#### **Configuring WPA-PSK Security With Funk Security**

Use this procedure to set WPA-PSK security on your CN3 Computer with Funk security.

- 1 Make sure you have configured the communications and radio parameters on your CN3 Computer and that Funk is your security choice.
- 2 Open Intermec Settings. Tap (+) to expand Communications > 802.11 Radio > Funk Security > Profile X with "X" being "1" through "4."
- **3** For Association, select "WPA" and press Enter.
- 4 For 8021x, select "None" and press Enter.
- **5** For **Pre-Shared Key**, enter the pre-shared key or the passphrase.

The pre-shared key must be a value of 32 hex pairs preceded by 0x for a total of 66 characters. The value must match the key value on the access point. The passphrase must be from 8 to 63 chtomaracters. After you enter a passphrase, the CN3 Computer internally converts it to a pre-shared key. This value must match the passphrase on the authenticator.

**6** Exit the Intermec Settings applet.

# **Using 802.1x Authentication**

802.1x authentication provides centralized user authentication using an authentication server, authenticators (access points), and supplicants. These components communicate using an EAP authentication type, such as TLS (Transport Layer Security) or PEAP (Protected Extensible Authentication Protocol). 802.1x security provides data encryption using dynamic WEP key management. To use 802.1x security, you need:

- An access point with an 802.11b/g radio.
- A CN3 Computer with an 802.11b/g radio and the 802.1x/WPA security option.

## Configuring 802.1x Security With Funk Security

Use this procedure to set 802.1x security on your CN3 Computer with Funk security.

- 1 Make sure you have configured the communications and radio parameters on your CN3 Computer and that Funk is your security choice.
- 2 Open Intermec Settings. Tap (+) to expand Communications > 802.11 Radio > Funk Security > Profile X with "X" being "1" through "4."
- **3** For **Association**, select "Open" and press **Enter**. When working with Cisco Aironet access points, you can select "Network-EAP."
- **4** For Encryption, select "WEP" and press Enter.
- 5 For 8021x, select "PEAP," "TLS," "TTLS," "LEAP," or "EAP-FAST" and press Enter.

If you select "TTLS" or "PEAP:"

- a Select User Name, type your user name, then press Enter.
- **b** Select User Password, type a user password, then press Enter.
- c For Validate Server Certificate, select "Yes," then press Enter. Note that you must have the date on the CN3 Computer set correctly when you enable Validate Server Certificate.
- **d** You must enter a User Name and Subject Name. You can also enter a Server 1 Common name or Server 2 Common name if you want to increase your level of security.

If you select "TLS:"

- **a** Load a user and root certificate on your CN3 Computer (page 128).
- **b** For Validate Server Certificate, select "Yes," then press Enter. Note that you must have the date on the CN3 Computer set correctly when you enable Validate Server Certificate.
- You must enter a User Name and Subject Name. You can also enter a Server 1 Common name or Server 2 Common name if you want to increase your level of security.

If you select "LEAP" or "EAP-FAST:"

- **a** Select **User Name**, type your user name, then press **Enter**.
- **b** Select User Password, type a user password, then press Enter.
- **7** Exit the Intermec Settings applet.

# **Using Static WEP Security**

The CN3 Computer uses the Wired Equivalent Privacy (WEP) protocol to add security to your wireless network based on the 802.11b/g standard. To use WEP security, you need an access point with an 802.11b/g radio.

# Configuring Static WEP Security With Funk Security

Use this procedure to set Static WEP security with Funk security.

- 1 Make sure you have configured the communications and radio parameters on your CN3 Computer and that Funk is your security choice.
- 2 Open Intermec Settings. Tap (+) to expand Communications > 802.11 Radio > Funk Security > Profile X with "X" being "1" through "4.".
- **3** For Association, select "Open" and press Enter.
- **4** For Encryption, select "WEP" and press Enter.
- **5** For **8021x**, select "None" and press **Enter**.
- **7** For Transmit key, select which WEP key to use for encryption of transmitted data.
- **8** Define a value for each key, up to four. Enter an ASCII key or a hex key either 5 or 13 bytes long based on the radio capability. Set a 5-byte value for 64-bit WEP or a 13-byte value for 128-bit WEP. Precede hex keys with 0x and make sure the keys use 5 or 13 hex pairs.
- **9** Exit the Intermec Settings applet.

# **Using the Profile Wizard**

To start 802.11b/g communications on the CN3 Computer, tap **Start** > **Settings** > the **System** tab > the **Wireless Network** icon to access the Profile Wizard for the 802.11b/g radio module.

#### Chapter 5 — Network Support

A profile contains all the information necessary to authenticate you to the network, such as login name, password or certificate, and protocols by which you are authenticated.

You can have up to four profiles for different networks. For example, you may have different login names or passwords on different networks, or you may use a password on one network, and a certificate on another.

Use the Profiles page to select and configure between the networking environments assigned to this 802.11b/g radio.

Profile

Tap the drop-down list to choose between four different profiles assigned to this unit, then tap Edit Select Profile, make the changes needed for this profile (starting on the next page), then tap ok to return to the Profiles page.

Enable Microsoft's

Wireless Zero Config application and disable the Intermec software solution for 802.11b/g, including configuration via the Wireless Network applet.

#### **Basic**

Use the Basic page to set the network type, name, and manage battery power for this profile. Tap **ok** to return to the Profiles page.

Profile Label	Enter a unique name for your profile.
Network type	Tap the list to select "Infrastructure" if the network uses access points to connect to the corporate network or internet; or "Ad-Hoc" to set up a private network with one or more participants.
Channel	If you select "Ad-Hoc" for the network type, select the channel on which you are communicating with others in your network. There are up to 11 channels available.
SSID (Net- work Name)	This assumes the profile name unless another name is entered in this field. If you want to connect to the next available network or are not familiar with the network name, enter "ANY" in this field. Consult your LAN administrator for network names.
Enable Power Management:	Check this box to conserve battery power (default), or clear this box to disable this feature.

# **Security**

The following are available from the 8021x Security drop-down list: None, PEAP (page 139), TLS (page 141), TTLS (page 142), LEAP (page 145), and EAP-FAST (page 146).

#### None

Use "None" to disable 802.1x security and enable WEP encryption. Set **8021x Security** as "None," **Association** to "Open," and **Encryption** to "None."

To enable WEP encryption:

- 1 Set 8021x Security as "None" and Association to "Open" or "Shared" as required to match the settings in your access point. Note "Open" is the recommended choice as "Shared" key authentication has security weaknesses.
- **2** Set Encryption to "WEP."

- **3** Select a data transmission key from the **Data TX Key** drop-down list near the bottom of this screen.
- **4** Enter an ASCII key or a hex key either 5 or 13 bytes long based on the radio capability in the appropriate **Key** # field. Set a 5-byte value for 64-bit WEP or a 13-byte value for 128-bit WEP. Precede hex keys with 0x and make sure the keys use 5 or 13 hex pairs.

To enable WPA encryption using a pre-shared key:

- 1 Set 8021x Security as "None."
- **2** Set Association to "WPA."
- **3** Enter the passphrase as ASCII (12345) in the **Pre-Shared Key** field.

To enable WPA2 encryption using a preshared key:

- 1 Set 8021x Security as "None."
- **2** Set Association to "WPA2."
- **3** Set Encryption to either "TKIP" or "AES."

**4** Enter the passphrase as ASCII (12345) in the Pre-Shared Key field.

#### **PEAP** (Protected EAP)

This protocol performs secure authentication against Windows domains and directory services. It is comparable to EAP-TTLS (see page 142), both in its method of operation and its security, though not as flexible. This does not support the range of inside-the-tunnel authentication methods supported by EAP-TTLS. Microsoft and Cisco both support this protocol.

Use "PEAP" to configure the use of PEAP as an authentication protocol and to select "Open," "WPA," "WPA2," or "Network EAP" as an association mode.

- 1 Set 8021x Security as "PEAP," then choose any of the following:
  - Set **Association** to "Open."
  - Set **Association** to "WPA."
  - Set Association to "WPA2" and Encryption to either "TKIP" or "AES."
  - Set **Association** to "Network EAP" and **Encryption** to either "WEP" or "CKIP."
- **2** Enter your unique Username and password to use this protocol.
- **3** Select **Prompt for password** to have the user enter this password each time to access the protocol; or leave **Use following password** as selected and enter your unique password to use the protocol without entering a password each time you use your CN3 Computer.
- 4 Tap Get Certificates to obtain or import server certificates. See page 144.

**5** Tap **Additional Settings** to assign an inner PEAP authentication and set options for server certificate validation and trust.

# **Additional PEAP Settings**

1 Select an authentication method from the Inner PEAP Authentication drop-down list.

EAP/MS-CHAP-V2	Authenticates against a Windows Domain Controller and other non-Windows user databases. This is Microsoft's implementation of PEAP.
EAP/Token Card	Use with token cards. The password value entered is never cached. This is Cisco's implementation of PEAP.
EAP/MD5-Challenge	Message Digest 5. A secure hashing authentication algorithm.

- **2** Check **Validate Server Certificate** to verify the identity of the authentication server based on its certificate when using PEAP.
- **3** Tap **Root CA**, select a root certificate, then **OK** to return to the Inner PEAP Authentication.
- **4** Enter the **Common Names** of trusted servers. Note that if these fields are left blank, the client will accept any authentication server with a valid certificate. For increased security, you should specify exactly which authentication servers you expect to use.
- **5** Tap **ok** to return to the Security page.

### TLS (EAP-TLS)

EAP-TLS is a protocol that is based on the TLS (Transport Layer Security) protocol widely used to secure web sites. This requires both the user and authentication server have certificates for mutual authentication. While cryptically strong, this requires corporations that deploy this to maintain a certificate infrastructure for all their users.

Use "TLS" to configure using EAP-TLS as an authentication protocol, pick "Open," "WPA," "WPA2," or "Network EAP" as an association mode.

- 1 Set 8021x Security as "TLS, then choose any of the following:
  - Set **Association** to "Open."
  - Set Association to "WPA."
  - Set **Association** to "WPA2" and **Encryption** to either "TKIP" or "AES."
  - Set Association to "Network EAP" and Encryption to either "WEP" or "CKIP."
- **2** Enter your unique **Subject Name** and **User Name** of the corresponding certificate installed on your CN3 Computer to use this protocol.
- **3** Tap **Get Certificates** to obtain or import server certificates. See page 144.
- **4** Tap **Additional Settings** to set options for server certificate validation and trust.

## Additional TLS Settings

- 1 Check Validate Server Certificate to verify the identity of the authentication server based on its certificate when using TLS.
- **2** Tap **Root CA**, select a root certificate, then tap **OK** to return to the TLS settings.
- 3 Enter the Common Names of trusted servers. Note that if these fields are left blank, the client will accept any authentication server with a valid certificate. For increased security, you should specify exactly which authentication servers you expect to use.

**4** Tap **ok** to return to the Security page.

#### TTLS (EAP-Tunneled TLS)

This protocol provides authentication like EAP-TLS (see page 141) but does not require user certificates. User authentication is done using a password or other credentials that are transported in a securely encrypted "tunnel" established using server certificates.

EAP-TTLS works by creating a secure, encrypted tunnel through which you present your credentials to the authentication server. Thus, inside EAP-TTLS there is another *inner authentication protocol* that you must configure via Additional TTLS Settings.

Use "TTLS" to configure EAP-TTLS as an authentication protocol, select "Open," "WPA," "WPA2," or "Network EAP" as an association mode.

- 1 Set 8021x Security as "TTLS," then choose one of the following:
  - Set Association to "Open." (default configuration)
  - Set Association to "WPA."
  - Set Association to "WPA2" and Encryption to either "TKIP" or "AES."
  - Set Association to "Network EAP" and Encryption to either "WEP" or "CKIP."
- **2** Enter your unique **Username** to use this protocol.
- **3** Select **Prompt for password** to have the user enter this password each time to access the protocol, or leave **Use following password** as selected and enter your unique password to use the protocol without entering a password each time you use your CN3 Computer.
- **4** Tap **Get Certificates** to obtain or import server certificates (see page 144).

Basic Security Advanced

8021x Security

TTLS

Association Encryption
Open WEP 

Username: Smonymous
Password
Prompt for password

Use following password:

Set Certificates Additional Settings

**5** Tap **Additional Settings** to assign an inner TTLS authentication and an inner EAP, and set the server certificate validation and trust.

#### **Additional TTLS Settings**

1 Select an authentication method from the **Inner TTLS Authentication** drop-down list.

PAP	Password Authentication Protocol. A simple authentication protocol that sends security information in the clear.
СНАР	Challenge Handshake Authentication Protocol. Use of Radius to authenticate a terminal without sending security data in the clear. Authenticates against non-Windows user databases. <i>You cannot use this if authenticating against a Windows NT Domain or Active Directory.</i>
MS-CHAP; MS-CHAP-V2	Authenticates against a Windows Domain Controller and other non-Windows user databases.
PAP/Token Card	Use with token cards. The password value entered is never cached.
EAP	Extensible Authentication Protocol

Cancel

- **2** If you select "EAP" for the inner authentication protocol, then select an inner EAP protocol from the **Inner EAP** drop-down list.
- 3 Enter the Common Names of trusted servers. Note that if these fields are left blank, the client will accept any authentication server with a valid certificate. For increased security, you should specify exactly which authentication servers you expect to use.
  - Check **Validate Server Certificate** to verify the identity of the authentication server based on its certificate when using TTLS.
- **4** Tap **Root CA**, select a root certificate, then tap **OK** to return to the Inner TTLS Authentication.
- **5** Enter the **Anonymous EAP-TTLS Name** as assigned for public usage. Use of this outer identity protects your login name or identity.

**6** Tap **ok** to return to the Security page.

#### **Get Certificates**

Certificates are pieces of cryptographic data that guarantee a public key is associated with a private key. They contain a public key and the entity name that owns the key. Each certificate is issued by a certificate authority.

Use this page to import a certificate onto the CN3 Computer.

#### **Root Certificates**

- 1 Tap the <<< button next to the **Import Root Certificate** field to select the root certificate (DER-encoded .CER file) to import.
- 2 Click Import Root Cert to install the selected certificate.

## User Certificate

- 1 Tap the <<< button next to the Certificate Path (.cer) field to select the user certificate (DER-encoded .CER file without the private key) to import.
- **2** Tap the <<< button next to the **Key Path** (.pvk) field to select the private key (.PVK file) which corresponds to the user certificate chosen in step 1.
- **3** Tap Import User Cert to install the selected certificate.

#### Web Enrollment

Tap Web Enrollment to obtain a user certificate over the network from an IAS Server.

Tap **ok** to return to the Security page.

**LEAP** (Cisco Lightweight EAP)

LEAP is the Cisco Lightweight version of EAP.

Use "LEAP" to configure the use of LEAP as an authentication protocol, select "Open," "WPA," "WPA2," or "Network EAP" as an association mode, or assign "Network EAP." *Note that this defaults to the Network EAP.* 

- 1 Set 8021x Security as "LEAP," then choose one of the following:
  - Set Association to "Open."
  - Set Association to "WPA."
  - Set Association to "WPA2" and Encryption to either "TKIP" or "AES."
  - Set Association to "Network EAP" and Encryption to either "WEP" or "CKIP."
- **2** Enter your unique Username to use this protocol.
- **3** Select **Prompt for password** to have the user enter this password each time to access the protocol, or leave **Use following password** as selected and enter your unique password to use the protocol without entering a password each time you use your CN3 Computer.

#### **EAP-FAST** (EAP-Flexible Authentication via Secured Tunnel)

The EAP-FAST protocol is a client-server security architecture that encrypts EAP transactions with a TLS tunnel. While similar to PEAP, it differs significantly as EAP-FAST tunnel establishment is based on strong secrets unique to users. These secrets are called Protected Access Credentials (PACs), which CiscoSecure ACS generates using a master key known only to CiscoSecure ACS. Because handshakes based upon shared secrets are intrinsically faster than handshakes based upon PKI, EAP-FAST is the significantly faster of the two solutions that provide encrypted EAP transactions. No certificate management is required to implement EAP-FAST.

Use "EAP-FAST" to configure the use of EAP-FAST as an authentication protocol, select "Open," "WPA," "Network EAP" as an association mode.

- 1 Set 8021x Security as "EAP-FAST," then choose one of the following:
  - Set Association to "Open."
  - Set Association to "WPA."
  - Set Association to "WPA2."
  - Set Association to "Network EAP" and Encryption to either "WEP" or "CKIP."
- **2** Enter your unique **Username** to use this protocol.
- **3** Select **Prompt for password** to have the user enter this password each time to access the protocol, or leave **Use following password** as selected and enter your unique password to use the protocol without entering a password each time you use your CN3 Computer.
- **4** Tap **Additional Settings** to set options for PAC management and assign an anonymous EAP-FAST name.

#### **Additional Settings**

- 1 Tap **PAC Manager** to view the PAC files currently installed on your CN3 Computer. Tap **ok** to return to the Additional Settings screen.
- 2 If you already have a PAC on your CN3 Computer, clear **Allow Automatic PAC provisioning** to avoid receiving additional PACs from the server.

- **3** If **Allow Automatic PAC provisioning** is checked, you can check:
  - Prompt before acquiring a new PAC for notification of any incoming PACs.
  - **Prompt before replacing a PAC** for notification whether to replace a current PAC with an incoming PAC.
- **4** Enter the **Anonymous EAP-FAST Name** as assigned for public usage. This outer identity protects your login name or identity.
- **5** Click **ok** to return to the Security page.

## **Advanced**

Use this page to configure additional settings for this profile.

#### • Detect Rogue APs:

Wireless NICs and APs associate based on the SSID configured for the NIC. Given an SSID, the BSSID with the strongest signal is often chosen for association. After association, 802.1x authentication may occur and during authentication credentials to uniquely identify a user - these are passed between the NIC and the AP.

The base 802.1x technology does not protect the network from "rogue APs." These can mimic a legitimate AP to authentication protocols and user credentials. This provides illegal users ways to mimic legitimate users and steal network resources and compromise security.

Check this box to detect and report client behavior suspected of being rogue APs. Once a rouge AP is detected, your CN3 Computer no longer associates with that AP until you perform a clean boot.

Clear this box to solve AP connection problems that result when an AP gets put on the rogue AP list due to inadvertent failed authentications and not because it is a real rouge.

### • Enable mixed cell:

Mixed cell is a profile-dependent setting. If enabled, using WEP, you can connect to access points that allow the optional use of encryption.

## Allow fast roaming (CCKM):

When using a wireless LAN that uses Cisco Access Points, a LEAP-enabled client device can roam from one access point to another without involving the authentication (RADIUS) server. If enabled, an access point configured to provide Wireless Domain Services (WDS) takes the place of the RADIUS server (caching credentials of an initial authentication with the RADIUS server) and authenticates the client without perceptible delay in voice or other time-sensitive applications.

Enable Logging:
 Check this box to log what activity occurs for this profile.

# **Configuring Microsoft Security**

The default security setting is Funk. If you want to use Microsoft security, you need to select it as your security choice.

1 Select Start > Settings > the System tab > the Intermec Settings icon.

2 Tap (+) to expand Communications > 802.11 Radio > Security Choice. Tap to select "Microsoft Security" from the drop-down list, press Enter.

- 3 An alert box appears telling you that you must save your settings and clean boot the CN3 Computer for your new security choice to take effect. Tap Yes or press Esc to clear this box.
- **4** Save your settings, then perform a clean-boot on the CN3 Computer.

Networks already configured are preferred networks. You can connect to only preferred networks or search for and connect to any available network.

A wireless network can be added either when the network is detected, or manually by entering settings information. To determine if authentication information is needed, see your network administrator.

1 Tap Start > Settings > the Connections tab > the Wi-Fi icon, then tap Add New . . .

**2** Enter a **Network name**. If the network was detected, the network name is entered and cannot change.

From Connects to, select to what your network is to connect. If you select "Work," you can do a VPN connection or use proxy servers. If you select "The Internet," you can connect directly to the internet.

To connect to an ad-hoc connection, select **This is a device-to-device** (ad-hoc) connection.

- **3** Do the following to disable WEP encryption:
  - **a** Set **Authentication** to either "Open" if WEP keys are not required; or "Shared" when WEP keys are required for association.
  - **b** Set **Data Encryption** to "Disabled."

- **4** Do the following to enable WEP encryption:
  - **a** Set **Authentication** to either "Open" if WEP keys are not required; or "Shared" when WEP keys are required for association.
  - **b** Set Data Encryption to "WEP."
  - **c** To change the network key, clear **The key is automatically provided**, then enter the new **Network key** and select the appropriate **Key index**.

- **5** Do the following to enable WPA authentication:
  - a Set Authentication to "WPA."
  - **b** Set **Data** Encryption to either "AES" or "TKIP."
  - c Enter the new **Network key**:

- **6** Do the following to enable WPA authentication using a preshared key:
  - a Set Authentication to "WPA-PSK."
  - **b** Set Data Encryption to either "AES" or "TKIP."
  - **c** Enter the new Network key.

- **7** Do the following to enable WPA2 authentication:
  - **a** Set Authentication to "WPA2."
  - **b** Set **Data** Encryption to either "AES" or "TKIP."
  - c Enter the new **Network key**:

- **8** Do the following to enable WPA2 authentication using a preshared key:
  - a Set Authentication to "WPA2-PSK."
  - **b** Set Data Encryption to either "AES" or "TKIP."
  - **c** Enter the new **Network key**.

**9** Tap **Next**, select either "PEAP" or "Smart Card or Certificate" for the EAP type, then tap **Properties** to adjust its settings. Tap **Finish** to return to the Configure Wireless Network screen.

From the Networks to access drop-down list, select "All Available," "Only access points," or "Only computer-to-computer" depending on the type of networks to which you connect. Tap ok to close this screen.

**Note**: If you select to connect to non-preferred networks, your CN3 Computer detects any new networks and provides configuration opportunities.

# Management

Use the following tool and information to configure and manage your network. You can also contact your Intermec representative for support.

# SmartSystems™ Foundation Console (www.intermec.com/SmartSystems)

This tool, available as a free download from Intermec, includes a management console that provides a default method to configure and manage Intermec devices "out-of-the-box," without the purchase of additional software licenses. This is for anyone who must configure and deploy multiple devices or manage multiple licenses.

Use the Intermec Settings applet to do device configuration settings within the SmartSystems Foundation. Information about the Intermec Settings applet is in the *Intermec Computer Command Reference Manual* (P/N: 073529) available online at www.intermec.com.

Information about the SmartSystems Foundation is available as an online help within the SmartSystems Console application. Select **SmartSystems** > **Help** in the console to access the manual.

See the Data Collection Resource Kit in the IDL for information about data collection functions. The IDL is available as a download from the Intermec web site at <a href="https://www.intermec.com/idl">www.intermec.com/idl</a>. Contact your Intermec representative for more information.

Tap **Start** > **Settings** > the **System** tab > the **Intermec Settings** icon, then tap to expand the **SmartSystems Information** option.

# **SNMP Configuration on the Mobile Computer**

In short, SNMP is an application-layer protocol that uses the exchange of management information between network devices. The CN3 Computer is such an SNMP-enabled device. Use SNMP to control and configure the CN3 Computer anywhere on an SNMP-enabled network.

The CN3 Computer supports four proprietary Management Information Bases (MIBs) and Intermec provides SNMP support for MIB-II through seven read-only MIB-II (RFC1213-MIB) Object Identifiers (OIDs).

**Note**: Only query the seven OIDs through an SNMP management station.

# **Management Information Base**

The Management Information Base is a database that contains information about the elements to be managed. The information identifies the management element and specifies its type and access mode (Read-Only, Read-Write). MIBs are written in ASN.1 (Abstract Syntax Notation.1) — a machine independent data definition language. *Note: Elements to manage are represented by objects. The MIB is a structured collection of such objects.* 

These MIB files are either in the CN3 Management Tools or on the web via www.intermec.com:

## • INTERMEC.MIB

Defines the root of the Intermec MIB tree.

#### • ITCADC.MIB

Defines objects for Automated Data Collection (ADC).

### • ITCSNMP.MIB

Defines objects for Intermec SNMP parameters and security methods, such as an SNMP security IP address.

#### • ITCTERMINAL.MIB

Defines objects for parameters, such as key clicks.

# **Object Identifiers**

Each object has a unique identifier called an OID, which consist of a sequence of integer values represented in dot notation. Objects are stored in a tree structure and OIDs are assigned based on the position of the object in the tree. For example, the internet OID is equal to 1.3.6.1.

MIB-II Item	OID	Group or Table	Description
ifNumber	1.3.6.1.2.1.2.1.0	Interfaces Group	Indicates the number of adapters present in the system. For the CN3 Computer, if one adapter is present in the system, then <i>ifNumber</i> = 1 and ifIndex = 1.
ifIndex	1.3.6.1.2.1.2.2.1.1.ifIndex	Interfaces Table (ifTable)	A unique value for each interface. The value ranges between 1 and the value of <i>ifNumber</i> .
ifDescr	1.3.6.1.2.1.2.2.1.2.ifIndex	Interfaces Table (ifTable)	A textual string containing information about the interface.
ifType	1.3.6.1.2.1.2.2.1.3.ifIndex	Interfaces Table (ifTable)	An integer containing information about the type of the interface. It is equal to 1 for Other.
ipAdEntAddr	1.3.6.1.2.1.4.20.1.1.IpAddress	IP address Table (ipAddrTable)	The IP address to which this entry's addressing information pertains (same as CN3 IP address), where IP Address is the valid non-zero IP address of the CN3 Computer.
ipAdEntIfIndex	1.3.6.1.2.1.4.20.1.2.IpAddress	IP address Table (ipAddrTable)	Index value that uniquely identifies the interface that this entry is applicable (same as ifIndex).
ipAdEntNetMask	1.3.6.1.2.1.4.20.1.3.IpAddress	IP address Table (ipAddrTable)	The subnet mask associated with the IP address of this entry <i>(same as Subnet Mask)</i> .

# **Configuring with SNMP**

The community string allows an SNMP manager to manage the CN3 Computer with a specified privilege level. The default read-only community string is "public" and "private" is the default read/write community string. See the specific configuration parameter to find its OID.

# To configure the CN3 Computers using SNMP

- 1 Configure CN3 Computers for RF communications.
- **2** Determine the OID (Object Identifier) for the parameter to change. The Intermec base OID is 1.3.6.1.4.1.1963.
- **3** Use your SNMP management station to get and set variables that are defined in the Intermec MIBs. You can set the traps, identification, or security configuration parameters for SNMP.
