FCC 47 CFR PART 22 SUBPART H AND PART 24 SUBPART E	No non-compliance noted

### We hereby certify that:

The above equipment was tested by Compliance Certification Services Inc. The test data, data evaluation, test procedures, and equipment configurations shown in this report were made in accordance with the procedures given in ANSI/TIA/EIA-603-A-2001 and the energy emitted by the sample EUT tested as described in this report is in compliance with conducted and radiated emission limits of FCC Rule FCC PART 22 Subpart H and PART 24 Subpart E.

The test results of this report relate only to the tested sample identified in this report.

Approved by:

Tony Houng

General Manager of Kunshan Laboratory Compliance Certification Services Inc. Reviewed by:

# **3. TEST METHODOLOGY**

Both conducted and radiated testing were performed according to the procedures document on chapter 13 of ANSI C63.4 and FCC CFR 47, 2.1046, 2.1047, 2.1049, 2.1051, 2.1053, 2.1055 and 2.1057.

# **EUT CONFIGURATION**

The EUT configuration for testing is installed on RF field strength measurement to meet the Commissions requirement and operating in a manner that intends to maximize its emission characteristics in a continuous normal application.

### **EUT EXERCISE**

The EUT was operated in the engineering mode to fix the TX frequency that was for the purpose of the measurements.

## **GENERAL TEST PROCEDURES**

### **Conducted Emissions**

The EUT is placed on the turntable, which is 0.8 m above ground plane. According to the requirements in Section 13.1.4.1 of ANSI C63.4.Conducted emissions from the EUT measured in the frequency range between 0.15 MHz and 30MHz using CISPR Quasi-peak and average detector modes.

### **Radiated Emissions**

The EUT is placed on a turn table, which is 0.8 m above ground plane. The turntable shall rotate 360 degrees to determine the position of maximum emission level. EUT is set 3m away from the receiving antenna, which varied from 1m to 4m to find out the highest emission. And also, each emission was to be maximized by changing the polarization of receiving antenna both horizontal and vertical. In order to find out the maximum emissions, exploratory radiated emission measurements were made according to the requirements in Section 13.1.4.1 of ANSI C63.4.

### **DESCRIPTION OF TEST MODES**

The EUT (model: C62Ca) had been tested under operating condition.

EUT staying in continuous transmitting mode was programmed. Channel Low, Mid and High were chosen for full testing.

After verification, all tests were carried out with the worst case test modes as shown below except radiated spurious emission below 1GHz, which worst case was in normal link mode only.

The field strength of spurious emission was measured in the following position: EUT stand-up position (Z axis), lie-down position (X, Y axis). The worst emission was found in stand-up position (Z axis) and the worst case was recorded.

# 4. INSTRUMENT CALIBRATION

The measuring equipment, which was utilized in performing the tests documented herein, has been calibrated in accordance with the manufacturer's recommendations for utilizing calibration equipment, which is traceable to recognized national standards.

# 5. FACILITIES AND ACCREDITATIONS

# FACILITIES

All measurement facilities used to collect the measurement data are located at CCS China Kunshan Lab at 10#, Weiye Rd, Innovation Park Eco. & Tec. Development Zone

Kunshan city JiangSu, (215300)CHINA.

The sites are constructed in conformance with the requirements of ANSI C63.7, ANSI C63.4 and CISPR Publication 22.

### EQUIPMENT

Radiated emissions are measured with one or more of the following types of linearly polarized antennas: tuned dipole, biconical, log periodic, bi-log, and/or ridged waveguide, horn. Spectrum analyzers with pre-selectors and quasi-peak detectors are used to perform radiated measurements.

Conducted emissions are measured with Line Impedance Stabilization Networks and EMI Test Receivers.

Calibrated wideband preamplifiers, coaxial cables, and coaxial attenuators are also used for making measurements.

All receiving equipment conforms to CISPR Publication 16-1, "Radio Interference Measuring Apparatus and Measurement Methods."

# LABORATORY ACCREDITATIONS AND LISTING

The test facilities used to perform radiated and conducted emissions tests are accredited by National Voluntary Laboratory Accreditation Program for the specific scope of accreditation under Lab Code: 200581-0 to perform Electromagnetic Interference tests according to FCC PART 15 AND CISPR 22 requirements. No part of this report may be used to claim or imply product endorsement by NVLAP or any agency of the US Government. In addition, the test facilities are listed with Federal Communications Commission (Registration no: 93105 and 90471).

Spectrum Analyzer	Agilent	E4446A	MY44020154	08/16/2006
Wireless communication test set	Agilent	8960	QB44051695	10/06/2006

**Remark:** Each piece of equipment is scheduled for calibration once a year.

### **Test Configuration**

Remark: Measurement setup for testing on Antenna connector

# **TEST PROCEDURE**

The transmitter output was connected to a calibrated attenuator, the other end of which was connected to a power meter. Transmitter output was read off the power meter in dBm. The power output at the transmitter antenna port was determined by adding the value of the attenuator to the power meter reading.

# **TEST RESULTS**

No non-compliance noted.

# **MEASUREMENT EQUIPMENT USED**

**Remark:** Each piece of equipment is scheduled for calibration once a year.

# **TEST CONFIGURATION**

### **Below 1 GHz**

Above 1 GHz

### For Substituted Method Test Set-UP

# **TEST PROCEDURE**

The EUT was placed on an non-conductive turntable using a non-conductive support. The radiated emission at the fundamental frequency was measured at 3 m with a test antenna and EMI spectrum analyzer.

During the measurement of the EUT, the resolution bandwidth was set to 3MHz and the average bandwidth was set to 3MHz. The highest emission was recorded with the rotation of the turntable and the lowering of the test antenna. The reading was recorded and the field strength (E in dBuV/m) was calculated.

ERP in frequency band 824-849MHz, and EIRP in frequency band 1851.25 –1910MHz were measured using a substitution method. The EUT was replaced by half-wave dipole (824-849MHz) or horn antenna (1851.25-1910MHz) connected to a signal generator. The spectrum analyzer reading was recorded and ERP/EIRP was calculated as follows:

ERP = S.G. output (dBm) + Antenna Gain (dBd) – Cable (dB) EIRP = S.G. output (dBm) + Antenna Gain (dBi) – Cable (dB)

# **TEST RESULTS**

No non-compliance noted.

Spectrum Analyzer	Agilent	E4446A	MY44020154	08/16/2006
Wireless communication test set	Agilent	8960	QB44051695	10/06/2006

**Remark:** Each piece of equipment is scheduled for calibration once a year.

### **Test Configuration**

**Remark:** Measurement setup for testing on Antenna connector

## **TEST PROCEDURE**

The EUT's output RF connector was connected with a short cable to the spectrum analyzer, RBW was set to about 1% of emission BW, VBW is set to 3 times the RBW, -26dBc display line was placed on the screen (or 99% bandwidth), the occupied bandwidth is the delta frequency between the two points where the display line intersects the signal trace.

The spectrum analyzer is set to: RBW = 3 kHz, VBW = 10 kHz, Span = 1 MHz, Sweep = 105.4 ms.

# TEST RESULTS

No non-compliance noted

# OUT OF BAND EMISSION AT ANTENNA TERMINALS

# LIMIT

According to FCC §2.1051, FCC §2.2917(f), FCC §22.917(f), FCC §24.238(a).

<u>Out of Band Emissions</u>: The mean power of emission must be attenuated below the mean power of the non-modulated carrier (P) on any frequency twice or more than twice the fundamental frequency by at lease  $43 + 10 \log P dB$ .

<u>Mobile Emissions in Base Frequency Range</u>: The mean power of any emissions appearing in the base station frequency range from cellular mobile transmitters operated must be attenuated to a level not exceed –80 dBm at the transmit antenna connector.

**Band Edge Requirements:** In the 1MHz bands immediately outside and adjacent to the frequency block, a resolution bandwidth of at lease 1% of the emission bandwidth of the fundamental emission of the transmitter may be employed to measure the Out of band Emission

# MEASUREMENT EQUIPMENT USED

Name of Equipment	Manufacturer	Model	Serial Number	<b>Calibration Due</b>

Out of band emission at antenna terminals:

# **TEST PROCEDURE**

The RF output of the transceiver was connected to a spectrum analyzer through appropriate attenuation. The resolution bandwidth of the spectrum analyzer was set at 1MHz, sufficient scans were taken to show the out of band Emissions if any up to 10th harmonic.

For the out of band: Set the RBW, VBW = 1MHz, Start=30MHz, Stop= 10 th harmonic. Limit = -13dBm

Band Edge Requirements (824 MHz and 849 MHz /1850MHz and 1910MHz): In the 1 MHz bands immediately outside and adjacent to the frequency block, a resolution bandwidth of at least 1 percent of the emission bandwidth of the fundamental emission of the transmitter may be employed to measure the out of band Emissions. Limit, -13dBm.

For the Band Edge: The spectrum analyzer is set to: RBW = 3 kHz, VBW = 10 kHz, Span = 1 MHz, Sweep = 105.4 ms

# **TEST RESULTS**

No non-compliance noted.

### **Test Configuration**

### Above 1 GHz

### Substituted Method Test Set-up

# **TEST PROCEDURE**

The EUT was placed on a non-conductive, the measurement antenna was placed at a distance of 3 meters from the EUT. During the tests, the antenna height and the EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. This maximization process was repeated with the EUT positioned in each of its three orthogonal orientations.

The frequency range up to tenth harmonic was investigated for each of three fundamental frequency (low, middle and high channels). Once spurious emission were identified, the power of the emission was determined using the substitution method.

The spurious emissions attenuation was calculated as the difference between radiated power at the fundamental frequency and the spurious emissions frequency.

ERP = S.G. output (dBm) + Antenna Gain (dBd) – Cable (dB)

EIRP = S.G. output (dBm) + Antenna Gain (dBi) - Cable (dB)

### TEST RESULTS

Refer to the attached tabular data sheets.

#### **Radiated Spurious Emission Measurement Result**

#### Below 1GHz

No emissions to be recorded. (Since no specific emission noted beyond the background noise floor)

#### Above 1GHz

Operation Mode: GSM 850 / TX / CH 128

DC POWER SUPPLY	GW instek	GPS-3303C	E903131	04/15/2007
Spectrum Analyzer	Agilent	E4446A	MY44020154	08/16/2006
Wireless communication test set	Agilent	8960	QB44051695	10/06/2006
Temp. / Humidity Chamber	Kingson	THS-M1	242	05/26/2006

**Remark:** Each piece of equipment is scheduled for calibration once a year.

#### **Test Configuration**

#### **Temperature Chamber**

Variable Power Supply

Remark: Measurement setup for testing on Antenna connector

## **TEST PROCEDURE**

The equipment under test was connected to an external AC or DC power supply and input rated voltage. RF output was connected to a frequency counter or spectrum analyzer via feed through attenuators. The EUT was placed inside the temperature chamber. Set the spectrum analyzer RBW low enough to obtain the desired frequency resolution and measure EUT 20°C operating frequency as reference frequency. Turn EUT off and set the chamber temperature to  $-30^{\circ}$ C. After the temperature stabilized for approximately 30 minutes recorded the frequency. Repeat step measure with  $10^{\circ}$ C increased per stage until the highest temperature of  $+50^{\circ}$ C reached.

Temp. / Humidity Chamber	Kingson	THS-M1	242	05/26/2006

**Remark:** Each piece of equipment is scheduled for calibration once a year.

### **Test Configuration**

#### Temperature Chamber

Variable Power Supply

**Remark:** Measurement setup for testing on Antenna connector.

## **TEST PROCEDURE**

Set chamber temperature to 20°C. Use a variable AC power supply / DC power source to power the EUT and set the voltage to rated voltage. Set the spectrum analyzer RBW low enough to obtain the desired frequency resolution and recorded the frequency.

Reduce the input voltage to specify extreme voltage variation ( $\pm$  15%) and endpoint, record the maximum frequency change.

## **TEST RESULTS**

No non-compliance noted.

# **POWERLINE CONDUCTED EMISSIONS**

### LIMIT

For an intentional radiator which is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed 250 microvolts (The limit decreases linearly with the logarithm of the frequency in the range 0.15 MHz to 0.50 MHz). The limits at specific frequency range is listed as follows:

Frequency Range (MHz)	Limits (dBµV)			
Trequency Range (MIII2)	Quasi-peak	Average		
0.15 to 0.50	66 to 56	56 to 46		
0.50 to 5	56	46		
5 to 30	60	50		

Compliance with this provision shall be based on the measurement of the radio frequency voltage between each power line (LINE and NEUTRAL) and ground at the power terminals.

## MEASUREMENT EQUIPMENT USED

Name of Equipment	Name of Equipment Manufacturer		Serial Number	<b>Calibration Due</b>
EMI Test Receiver	R&S	ESI26	100068	02/11/2007
EMC Analyzer	Agilent	Agilent E7402A US411		02/11/2007
LISN	FCC	FCC-LISN-50-50-2-M	01067	07/29/2006
LISN (EUT)	FCC	FCC-LISN-50-50-2-M	01068	07/29/2006
TRANSIENT LIMITER	SCHAFFNER	CFL9206	1710	03/15/2007
EMI Monitor control box	FCC	0-SVDC	N/A	N.C.R

**Remark:** Each piece of equipment is scheduled for calibration once a year.

#### **Test Configuration**

See test photographs attached in Appendix 1 for the actual connections between EUT and support equipment.

## **TEST PROCEDURE**

- 1. The EUT was placed on a table, which is 0.8m above ground plane.
- 2. Maximum procedure was performed on the six highest emissions to ensure EUT compliance.
- 3. Repeat above procedures until all frequency measured were complete..

### DECISION OF FINAL TEST MODE

- 1. The following test mode(s) were scanned during the preliminary test:
  - 1. AC to DC charger :Trade Name :Alcatel ; Model Number :3DS09371AGAA Manufactures: Astec
  - 2. AC to DC charger:Trade Name :Alcatel; Model Number :3DS09371AGAA Manufactures: Leader
  - 3. AC to DC charger: Trade Name :Alcatel; Model Number :3DS09371AAAA Manufactures: Astec
  - 4. AC to DC charger: Trade Name :Alcatel; Model Number : 3DS09371AAAA Manufactures: Leader
  - 5. DC to DC charger: Trade Name :Alcatel; Model Number :3DS07848AAAA Manufactures: Primax

2. After the preliminary scan, the following test mode was found to produce the highest emission level.

- 2. AC to DC charger:Trade Name :Alcatel; Model Number :3DS09371AGAA Manufactures: Leader
- 5. DC to DC charger: Trade Name :Alcatel; Model Number :3DS07848AAAA Manufactures: Primax

## TEST RESULTS

The initial step in collecting conducted data is a spectrum analyzer peak scan of the measurement range. Significant peaks are then marked as shown on the following data page, and these signals are then quasi-peaked.

	Link mode

#### Remark:

- 1. The measuring frequencies range between 0.15 MHz and 30 MHz.
- 2. The emissions measured in the frequency range between 0.15 MHz and 30MHz were made with an instrument using Quasi-peak detector and Average detector.
- *3. "---" denotes the emission level was or more than 2dB below the Average limit, and no re-check was made.*
- 4. The IF bandwidth of SPA between 0.15MHz and 30MHz was 10KHz. The IF bandwidth of Test Receiver between 0.15MHz and 30MHz was 9kHz
- 5. *L1* = *Line One (Live Line) / L2* = *Line Two (Neutral Line)*

#### Note:

Freq.	_	Emission	fro	auency	in	$KH_7$
rreq.	—	Emission	jrea	quency	ın	ΛΠζ,

```
Factor (dB) = cable loss + Insertion loss of LISN+ Insertion loss of TRANSIENT LIMITER (The TRANSIENT LIMITER included 10 dB ATTENUATION)
```

- $\begin{array}{l} \textit{Amptd } \textit{dBuV} = \textit{Uncorrected Analyzer/Receiver reading} + \textit{cable loss} + \textit{Insertion loss of LISN} + \\ \textit{Insertion loss of TRANSIENT LIMITER,} \\ \textit{if it} > 0.5 \textit{ dB} \end{array}$
- *Limit dBuV* = Limit stated in standard

*Margin dB* = *Reading in reference to limit* **Calculation Formula** 

Margin (dB) = Amptd (dBuV) - Limit (dBuV)
