Another cable connects the two ports of the Spectrum Analyzer to the bottom port of the Splitter. From the right side of the Splitter, a cable goes to a black 'ATT' (Attenuator) box. Finally, a cable connects the ATT to the left side of a white 'EUT' (Equipment Under Test) device, which has a black screen.</p> |
| Test Procedure: | <ol style="list-style-type: none"> 1. The EUT's output RF connector was connected with a short cable to the spectrum analyzer 2. RBW was set to about 1% of emission BW, VBW= 3 times RBW. 3. -26dBc display line was placed on the screen (or 99% bandwidth), the occupied bandwidth is the delta frequency between the two points where the display line intersects the signal trace. |

6.4 Modulation Characteristic

According to FCC § 2.1047(d), Part 22H & 24E there is no specific requirement for digital modulation, therefore modulation characteristic is not presented.

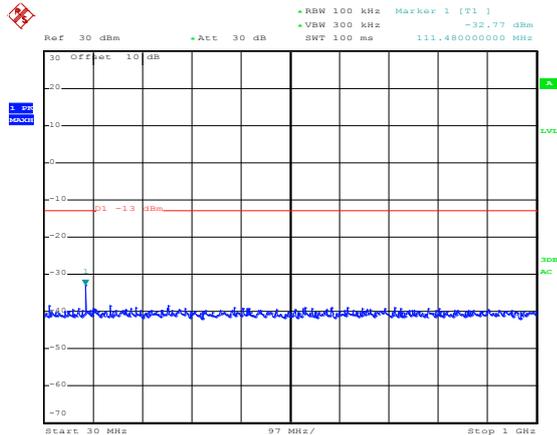

6.5 Out of band emission at antenna terminals

| | |
|-------------------|--|
| Test Requirement: | FCC part 22.917(a), FCC part 24.238(a) |
| Test Method: | ANSI/TIA-603-D 2010 |
| Limit: | -13dBm |
| Test setup: |  <p>The diagram shows a test setup. On the left, there are two blue rectangular units: the top one is labeled 'System simulator' and the bottom one is labeled 'Spectrum Analyzer'. Both have a screen and two circular ports on the right side. A single line from the top port of the System simulator and a single line from the top port of the Spectrum Analyzer merge into a single line that enters a white rectangular 'Splitter' box. From the right side of the Splitter, a line goes to a black rectangular 'ATT' (attenuator) box. From the right side of the ATT, a line goes to a white rectangular 'EUT' (Equipment Under Test) box.</p> |
| Test Procedure: | <ol style="list-style-type: none"> 1 The RF output of the transceiver was connected to a spectrum analyzer through appropriate attenuation. 2 The resolution bandwidth of the spectrum analyzer was set at 100 kHz when below 1GHz, 1MHz when above 1 GHz; sufficient scans were taken to show the out of band Emissions if any up to 10th harmonic. 3 For the out of band: Set the RBW=100 kHz, VBW=300 kHz when below 1 GHz, RBW =1 MHz, VBW=3 MHz when above 1 GHz, Start=30MHz, Stop= 10th harmonic. 4 Band Edge Requirements: In the 1 MHz bands immediately outside and adjacent to the frequency block, a resolution bandwidth of at least 1 percent of the emission bandwidth of the fundamental emission of the transmitter may be employed to measure the out of band Emissions. |

6.6 Field strength of spurious radiation measurement

| | |
|-------------------|---|
| Test Requirement: | FCC part 22.917(a), FCC part 24.238(a) |
| Test Method: | ANSI/TIA-603-D 2010 |
| Limit: | -13dBm |
| Test setup: | <p>Below 1GHz</p>  <p>Above 1GHz</p>  |
| Test Procedure: | <ol style="list-style-type: none"> 1. The EUT was placed on an non-conductive turntable using a non-conductive support. The radiated emission at the fundamental frequency was measured at 3 m with a test antenna and EMI spectrum analyzer. 2. During the tests, the antenna height and the EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. This maximization process was repeated with the EUT positioned in each of its three orthogonal orientations. 3. The frequency range up to tenth harmonic was investigated for each of three fundamental frequency (low, middle and high channels). Once spurious emission was identified, the power of the emission was determined using the substitution method. 4. The spurious emissions attenuation was calculated as the difference between radiated power at the fundamental frequency and the spurious emissions frequency. $ERP / EIRP = S.G. \text{ output (dBm)} + \text{Antenna Gain(dB/dBi)} - \text{Cable Loss (dB)}$ |
