

# TEST REPORT

## 1. Applicant

**Name** : Handheld Group AB  
**Address** : Kinnegatan 17A S-531 33 Lidköping, Sweden

## 2. Products

**Name** : Mobile Computer  
**Model** : NAUTIZ X4  
**Manufacturer** : POINTMOBILE CO.,LTD

**3. Test Standard** : FCC 47 CFR § 2.1093

**4. Test Method** : IEEE 1528-2003

**5. Test Results** : Positive

**6. Date of Application** : January 16, 2014

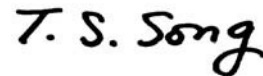

**7. Date of Issue** : June 20, 2014

Tested by

Jong-gon Ban  
ICT Infrastructure  
Technology Center  
Senior Engineer

Approved by

Tae-Seung Song  
ICT Infrastructure  
Technology Center  
Manager

*The test results contained apply only to the test sample(s) supplied by the applicant, and this test report shall not be reproduced in full or in part without approval of the KTL in advance.*

# 1. Administrative Information

## 1.1. Applicant Data

<b>Company Name</b>	<b>Handheld Group AB</b>
Address	Kinnegatan 17A S-531 33 Lidköping, Sweden
<b>Contact Person</b>	
Name	Jerker Hellstrom
E-mail	j.hellstrom@handheldgroup.com
Phone	+46(0)510-54 7170

## 1.2. Manufacturer Data (only if different from Applicant)

<b>Company Name</b>	<b>POINTMOBILE CO.,LTD</b>
Address	Gasan-dong, B-9F Kabul Great Valley 32, Digital-ro9-gil, Geumcheon-gu, Seoul, Korea
<b>Contact Person</b>	
Name	Chloe Kim
E-mail	chloe.kim@pointmobile.co.kr
Phone	+82 70 7090 2642

## 1.3. Testing Laboratory Data

The following list shows all places and laboratories involved for test result generation.

<b>Company Name</b>	<b>Korea Testing Laboratory</b>
Address	723 Haean-ro, Sangnok-Gu, Ansan-Si, Gyeonggi-Do, 426-901 KOREA
<b>Contact Person</b>	
Name	Jong-gon Ban
E-mail	banjg@ktl.re.kr
Phone	+82-31-500-0133
Fax	+82-31-500-0149

## 2. EUT Information

### 2.1. General Description of the EUT

The following section lists all specifications of EUT (Equipment Under Test) involved in test. Additionally, KTL has received sufficient documentation from the client and/or manufacturer to perform the tests

General Information	
FCC ID & Model Number	FCC ID: <b>YY3-14244C</b> , Model Number: <b>NAUTIZ X4</b>
SKU	NX4-1DCN-0-E
BT, WiFi, CDMA, GPS, Camera, 1D scanner, Numeric Key	
S scanner/Decode Capabilities	1D Laser model: N4313 or uE966 laser engine.
GSM Specification	CDMA850/1900, 1xEVDO Rev0/A
Antenna Type	Internal Antenna
WLAN Specification	802.11 b/g/n (HT20)
WLAN VoIP	Supported
Bluetooth Specification	V2.1+EDR
Mobile Hotspot	Not supported
Battery options	Li-ion, 3.7 V (400mAh)
Device Dimension	Overall (Length x width) : 154 mm x 75 mm Overall Diagonal :158mm Display Diagonal : 89 mm

### 2.2. SAR Results Summaries

Band & Mode	Tx Frequency	SAR	
		1 g Head (W/kg)	1g Body (W/kg)
CDMA850	824.70 ~ 848.31 MHz	0.594	0.422
CDMA1900	1851.25 ~ 1908.75 MHz	0.167	0.196
2.4 GHz WLAN	2412 ~ 2462 MHz	0.210	0.198

### 3. SAR DEFINITION

Specific Absorption Rate (SAR) is defined as the time derivative (rate) of the incremental energy (dU) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dV) of a given density(p). It is also defined as the rate of RF energy absorption per unit mass at a point in an absorbing body. (see Figure.1)

$$SAR = \frac{d}{dt} \left( \frac{dU}{dm} \right) = \frac{d}{dt} \left( \frac{dU}{p dv} \right)$$

Figure 1 SAR Mathematical Equation

SAR is expressed in units of Watts per Kilogram (W/kg).

$$SAR = \sigma E^2 / \rho$$

Where :

- $\sigma$  = conductivity of the tissue-simulant material (S/m)
- $\rho$  = mass density of the tissue-simulant material (kg/m<sup>3</sup>)
- $E$  = Total RMS electric field strength (V/m)

Note: The primary factors that control rate or energy absorption were found to be the wavelength of the incident field in relations to the dimensions and geometry of the irradiated organism, the orientation of the organism in relation to the polarity of field vectors, the presence of reflecting surfaces, and whether conductive contact is made by the organism with a ground plane.[4]

### 4. TEST METHODOLOGY

The tests documented in this report were performed in accordance with IEEE Standard 1528-2003 and the following published KDB procedures.

- FCC KDB Publication 941225 D01 SAR test for 3G devices v02
- FCC KDB Publication 447498 D01v05r02 (General SAR Guidance)
- FCC KDB Publication 648474 D04 Handset SAR v01r02
- FCC KDB Publication 865664 D01 SAR measurement 100 MHz to 6 GHz v01r03
- FCC KDB Publication 865664 D02 SAR Reporting v01r01

## 5. DESCRIPTION OF SAR MEASUREMENT SYSTEM

The DASY4 system used for performing compliance tests consists of the following items:

**Figure 2 SAR Measurement System**

- A standard high precision 6-axis robot with controller, teach pendant and software.
- Data acquisition electronics, DAE4 consists of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain- switching multiplexer, a fast 16 bit AD-converter and a command decoder and control logic unit.
- Transmission to the PC-card is accomplished through an optical downlink for data and status information and an optical uplink for commands and clock lines.
- The mechanical probe mounting device includes two different sensor systems for frontal and sidewise probe contacts.
- The robot uses its own controller with a built in VME-bus computer. Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc.
- The phantom, the device holder and other accessories according to the targeted measurement.

## 6. SYSTEM VERIFICATION

### 6.1. Tissue Simulating Mixture Characterization

The mixture is characterized to obtain proper dielectric constant (permittivity) and conductivity of the tissue of interest. The tissue dielectric parameters recommended in IEEE 1528 and IEC 62209 have been used as targets for the compositions, and are to match within 5%, per the FC recommendations.

Ingredients (% by weight)	Frequency (MHz)							
	835		1900		2450		5200-5800	
Tissue Type	Head	Body	Head	Body	Head	Body	Head	Body
Water	41.45	52.4	54.9	40.4	62.7	73.2	62.52	78.66
Salt (NaCl)	1.45	1.4	0.18	0.5	0.5	0.04	0.0	0.0
Sugar	56.0	45.0	0.0	58.0	0.0	0.0	0.0	0.0
HEC	1.0	1.0	0.0	1.0	0.0	0.0	0.0	0.0
Bactericide	0.1	0.1	0.0	0.1	0.0	0.0	0.0	0.0
Triton X-100	0.0	0.0	0.0	0.0	36.8	0.0	17.24	10.67
DGBE	0.0	0.0	44.92	0.0	0.0	26.7	0.0	0.0
Diethylene glycol hexyl ether	-	-	-	-	-	-	17.24	10.67

**Table 2 Composition of the Tissue Equivalent Materials**

- Salt: 99+% Pure Sodium Chloride Sugar: 98+% Pure Sucrose
- Water: De-ionized, 16 MΩ+ resistivity HEC: Hydroxyethyl Cellulose
- DGBE: 99+% Di(ethylene glycol) butyl ether, [2-(2-butoxyethoxy)ethanol]
- Triton X-100 (ultra pure): Polyethylene glycol mono [4-(1,1, 3, 3-tetramethylbutyl)phenyl]ether

### 6.2. Tissue Verification

The dielectric parameters of the brain and muscle simulating liquid were measured prior to SAR assessment using the HP85070D dielectric probe kit and Agilent 8753D Network Analyzer. The actual dielectric parameters are shown in the following table. The below measured tissue parameters were used in DASY software.

Freq. [MHz]	Liquid	Date	Liquid Temp [°C]	Parameters	Target Value	Measured Value	Dev. (%)	Limit (%)				
824.7	Head	05/12/2014	22.3	$\epsilon_r$ $\sigma$	41.5 0.90	42.3	+1.9	± 5				
						0.89	-1.1

							1.91		-2.1
2462		05/14/2014	23.1				52.3		-0.8
							1.91		-2.1

**Table 3 Measured Simulating Liquid Dielectric Values**

The humidity and dielectric/ambient temperatures are recorded during the assessment of the tissue material dielectric parameters. The difference between the ambient temperature of the liquid during the dielectric measurement and the temperature during tests was less than  $|2|^\circ\text{C}$ .

### 6.3. System Validation

Prior to the SAR assessment, the system validation kit was used to verify that the DASY4 was operating within its specifications. The validation dipoles are highly symmetric and matched at the centre frequency for the specified liquid and distance to the phantom. The accurate distance between the liquid surface and the dipole centre is achieved with a distance holder that snaps onto the dipole. System validation is performed by feeding a known power level into a reference dipole, set at a known distance from the phantom. The measured SAR is compared to the theoretically derived level.

The same SAR probe(s) and tissue-equivalent media combinations used with each specific SAR system for system verification must be used for device testing. When multiple probe calibration points are required to cover substantially large transmission bands, independent system verifications are required for each probe calibration point. A system verification must be performed before each series of SAR measurements using the same probe calibration point and tissue-equivalent medium. Additional system verification should be considered according to the conditions of the tissue-equivalent medium and measured tissue dielectric parameters typically every three to four days when the liquid parameters are re-measured or sooner when marginal liquid parameters are used at the beginning of a series of measurements.

The measured 1g(10g) SAR should be within 10 % of the expected target reference values at the time of calibration by the calibration facility.

Tissue Frequency (MHz)	Tissue Type	Date	Probe SN	Dipole SN	Measured SAR 1g (W/kg)	Target SAR 1g (W/kg)	Deviation (%)	Limit (%)
835	Head	02/21/2014	3972	481	10.28	9.84	+4.5	±10
835	Head	05/12/2014	3020	481	10.36		+5.3	
835	Body	05/12/2014	3020	481	10.32	10.0	+3.2	±10
1900	Head	02/24/2014	3972	5d038	39.56	40.4	-2.1	±10
1900	Head	05/13/2014	3020	5d038	42.8		+5.9	
1900	Body	02/25/2014	3972	5d038	44.0	40.8	+7.3	±10
1900	Body	05/13/2014	3020	5d038	40.4		-1.0

2450	Head	05/14/2014	3020	746	53.6		+1.5	
2450	Body	02/28/2014	3972	746	53.2	50.0	+6.4	±10
2450	Body	05/14/2014	3020	746	52.8		+5.6	

**Table 4 Deviation from Reference Validation Values**

## 7. SAR MEASUREMENT PROCEDURE USING DASY4

The SAR evaluation is performed with the SPEAG DASY4 system as following;

### Step 1: Power Reference Measurement

A measurement of the SAR value at a fixed location is used as a reference value for assessing the power drop of the EUT. The SAR at this point is measured at the start of the test and then again at the end of the test.

### Step 2: Area Scan

The Area Scan is used as a fast scan in two dimensions to find the area of high field values, before doing a fine scanning measurement around the hot spot. The sophisticated interpolation routines implemented in DASY software can find the maximum locations even in relatively coarse grids. When an Area Scan has measured all reachable points, it computes the field maximal found in the scanned area, within a range of the global maximum. The range (in dB) is specified in the standards for compliance testing. For example, a 2dB range is required in IEEE Standards 1528 and IEC 62209 standards. If only one Zoom Scan follows the Area Scan, then only the absolute maximum will be taken as reference. For cases where multiple maximums are detected, the number of Zoom Scans has to be increased accordingly.

Area Scan Parameters are as below table from KDB 865664 D01 SAR Measurement 100MHz to 6GHz v01r01.

	≤ 3 GHz	> 3 GHz
Maximum distance from closest measurement point (geometric center of probe sensors) to phantom surface	5 ± 1 mm	$\frac{1}{2} \cdot \delta \cdot \ln(2) \pm 0.5$ mm
Maximum probe angle from probe axis to phantom surface normal at the measurement location	30° ± 1°	20° ± 1°
Maximum area scan spatial resolution: $\Delta x_{Area}$ , $\Delta y_{Area}$	≤ 2 GHz: ≤ 15 mm 2 – 3 GHz: ≤ 12 mm	3 – 4 GHz: ≤ 12 mm 4 – 6 GHz: ≤ 10 mm
	When the x or y dimension of the test device, in the measurement plane orientation, is smaller than the above, the measurement resolution must be ≤ the corresponding x or y dimension of the test device with at least one measurement point on the test device.	

### Step 3: Zoom Scan

Zoom Scans are used to assess the peak spatial SAR values within a cubic averaging volume containing 1g and 10g of simulated tissue. The Zoom Scan measures points (refer to table below) within a cube whose base faces are centered on the maxima found in a preceding area scan job within the same procedure. When the measurement is done, the Zoom Scan evaluates the averaged SAR for 1g and 10g and displays these values next to the job's label.

Zoom Scan Parameters are as below table from KDB 865664 D01 SAR Measurement 100MHz to 6GHz v01r01.

Maximum zoom scan spatial resolution: $\Delta x_{Zoom}$ , $\Delta y_{Zoom}$		$\leq 2$ GHz: $\leq 8$ mm 2 – 3 GHz: $\leq 5$ mm*	3 – 4 GHz: $\leq 5$ mm* 4 – 6 GHz: $\leq 4$ mm*
Maximum zoom scan spatial resolution, normal to phantom surface	uniform grid: $\Delta z_{Zoom}(n)$	$\leq 5$ mm	3 – 4 GHz: $\leq 4$ mm 4 – 5 GHz: $\leq 3$ mm 5 – 6 GHz: $\leq 2$ mm
	graded grid	$\Delta z_{Zoom}(1)$ : between 1 <sup>st</sup> two points closest to phantom surface	$\leq 4$ mm
		$\Delta z_{Zoom}(n>1)$ : between subsequent points	$\leq 1.5 \cdot \Delta z_{Zoom}(n-1)$
Minimum zoom scan volume	x, y, z	$\geq 30$ mm	3 – 4 GHz: $\geq 28$ mm 4 – 5 GHz: $\geq 25$ mm 5 – 6 GHz: $\geq 22$ mm
Note: $\delta$ is the penetration depth of a plane-wave at normal incidence to the tissue medium; see draft standard IEEE P1528-2011 for details. * When zoom scan is required and the <i>reported</i> SAR from the <i>area scan based 1-g SAR estimation</i> procedures of KDB 447498 is $\leq 1.4$ W/kg, $\leq 8$ mm, $\leq 7$ mm and $\leq 5$ mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.			

#### Step 4: Power drift measurement

The Power drift Measurement measures the field at the same location as the most recent power reference measurement within the same procedure, and with the same settings.

#### Step 5: Z-Scan (FCC only)

The Z Scan measures points along a vertical straight line. The line runs along the Z-axis of a one-dimensional grid. In order to get a reasonable extrapolation the extrapolated distance should not larger than the step size in Z-direction.

## 8. DESCRIPTION OF TEST POSITION

SAR measurements were performed in the “cheek” and “tilted” positions on left and right sides of the phantom according to IEEE 1528. Both were measured in the head section of the SAM Twin Phantom.

Figure 3 Handset vertical and horizontal reference line

### 8.1. Cheek Position

Figure 4 Side view of SAM phantom

The device was positioned with the vertical center line of the body of the device and the horizontal line crossing the center (see Figure 3) of the ear piece in a plane parallel to the sagittal plane of the phantom(see Figure 4). While maintaining the device in this plane, it was aligned the vertical center line with the reference plane containing the three ear and mouth reference points(M, RE and LE) and aligned the center of the ear piece with the line RE-LE. Then device was translated towards the phantom with the ear piece aligned with the line LE-RE until it touched the ear. While maintaining the device in the reference plane and maintaining the device contact with the ear, the bottom of the device was moved until any point on the front side is in contact with the cheek of the phantom.(see Figure 5)

Figure 5 Cheek/Touch Position

## 8.2. Tilt Position

The device was positioned in the “Cheek” position. While maintaining the device in the reference plane described above cheek position and pivoting against the ear, device was moved outward away from the mouth by an angle of 15 degrees. (see Figure 6)

Figure 6 Ear/Tilt Position

Body-worn operating configurations are tested without the belt-clips and holsters attached to the device and positioned against a flat phantom in a normal use configuration.

Accessories for Body-worn operation configurations are divided into two categories: those that do not contain metallic components and those that do contain metallic components. When multiple accessories that do not contain metallic components are supplied with the device, the device is tested with only the accessory that dictates the closest spacing to the body. Then multiple accessories that contain metallic components are tested with the device with each accessory. If multiple accessories share an identical metallic component (i.e. the same metallic belt-clip used with different holsters with no other metallic components) only the accessory that dictates the closest spacing to the body is tested.

---

### 8.3. Body Holster/ Belt Clip Configurations

Body-worn accessories may not always be supplied or available as options for some devices intended to be authorized for body-worn use. In this case, a test configuration with a separation distance between the device and the flat phantom is used. Test position spacing was documented.

Transmitters that are designed to operate in front of a person's face, as the push-to-talk configurations, are test for SAR compliance with the front of the device positioned to face the flat phantom in brain fluid. For devices that are carried next to the body such as a shoulder, waist or chest-worn transmitters, SAR compliance is tested with the accessories, including headsets and microphones, attached to the device and positioned against a flat phantom in a normal use configuration.

In all cases SAR measurements are performed to investigate the worst-case positioning. Worst-case positioning is then documented and used to perform Body SAR testing.

## 9. MEASUREMENT UNCERTAINTY

Applicable for frequencies up to 6GHz

Uncertainty Component	Tol. (%)	Prob Dist	Div	$c_i$ 1g	$c_i$ 10g	$u_i$ (%) 1g	$u_i$ (%) 10g	$\nu_i$

## 10. RF Exposure Limits

HUMAN EXPOSURE	UNCONTROLLED ENVIRONMENT	CONTROLLED ENVIRONMENT
	General Population (W/Kg) or (mW/g)	Occupational (W/Kg) or (mW/g)
SPATIAL PEAK SAR (Brain)	1.60	8.00
SPATIAL AVERAGE SAR (Whole Body)	0.08	0.40
SPATIAL PEAK SAR (Hand / Feet / Ankle / Wrist)	4.00	20.00

Table 6 Safety Limits for Partial Body Exposure

NOTE :

\* The Spatial Peak value of the SAR averaged over any 1 gram of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.

Uncontrolled Environments are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.

Controlled Environments are defined as locations where there is exposure that may be incurred by persons who are aware of the potential for exposure, (i.e.as a result of employment or occupation).

## 11. RF CONDUCTED POWERS

### 11.1. Nominal and Maximum Output Power Specifications

This device operates using the following maximum and nominal output power specifications. SAR values were scaled to the maximum allowed power to determine compliance per KDB Publication 447498 D01v05.

Mode		Modulated Average Power (dBm)
CDMA850	Maximum	25
	Nominal	24
CDMA1900	Maximum	25
	Nominal	24
IEEE 802.11b (2.4G)	Maximum	16
	Nominal	14.5
IEEE 802.11g (2.4G)	Maximum	16
	Nominal	14.5
IEEE 802.11n (2.4G)	Maximum	16
	Nominal	14.5

### 11.2. SAR scaling factors sample calculation

Scaled SAR results are derived after scaling factors are applied to the measured values as below. Scaling for maximum tune-up tolerance must be considered separately.

SAR Section	Test Position	Mode	Scanner	Dist. (mm)	Freq. (MHz)	CH #	Power (dBm)		SAR 1g (W/kg)	Scaling Factor	Scaled SAR 1g (W/kg)	Plot. No.
							Max. allowed	Measured				
Head	Right Touch	SO55	1D N4313	N/A	836.52	384	25.0	24.65	0.523	1.084	<b>0.567</b>	1

\*Scaled SAR = Measured SAR x Scaling Factor

$$0.567 = 0.523 \times 1.084$$

### 11.3.CDMA Conducted output Power Measurements

See 3GPP2 C.S0011/TIA-98-E as recommended by "SAR Measurement Procedures for 3G Devices", May 2006. Maximum output power is verified on the High, Middle and Low channels according to procedures defined in section 4.4.5.2 of 3GPP2 C.S0011/TIA-98-E. SO55 tests were measured with power control bits in "All Up" condition.

#### Head SAR Measurement

SAR for head exposure configurations is measured in RC3 with the DUT configured to transmit at full rate using Loopback Service Option SO55. SAR for RC1 is not required when the maximum average output of each channel is less than ¼ dB higher than that measured in RC3. Otherwise, SAR is measured on the maximum output channel in RC1 using the exposure configuration that results in the highest SAR for that channel in RC3.

#### Body SAR Measurement

SAR for body exposure configurations is measured in RC3 with the DUT configured to transmit at full rate on FCH with all other code channels disabled using TDSO / SO32. SAR for multiple code channels (FCH + SCHn) is not required when the maximum average output of each RF channel is less than ¼ dB higher than that measured with FCH only. Otherwise, SAR is measured on the maximum output channel (FCH + SCHn) with FCH at full rate and SCH0 enabled at 9 600 bps using the exposure configuration that results in the highest SAR for that channel with FCH only. When multiple code channels are enabled, the DUT output may shift by more than 0.5 dB and lead to higher SAR drifts and SCH dropouts. Body SAR in RC1 is not required when the maximum average output of each channel is less than ¼ dB higher than that measured in RC3. Otherwise, SAR is measured on the maximum output channel in RC1; with Loopback Service Option SO55, at full rate.

Band	Channel	SO55	SO55	TDSO SO32 FCH	TDSO SO32 FCH+SCHn	1xEVDO Rev.0	1xEVDO Rev.0	1xEVDO Rev. A	1xEVDO Rev. A
		RC1	RC3	RC3	RC3	(FTAP)	(RTAP)	(FETAP)	(RETAP)
CDMA	1013	24.20	24.20	24.16	24.10	24.01	24.02	24.02	24.01
	384	24.47	24.45	24.43	24.40	24.38	24.37	24.36	24.37
	777	24.55	24.54	24.50	24.44	24.32	24.32	24.29	24.28
PCS	25	24.75	24.71	24.70	24.61	24.61	24.60	24.59	24.59
	600	24.50	24.50	24.44	24.39	24.23	24.22	24.21	24.20

Figure 7 Power Measurement Setup

### 11.4.802.11b/g/n (2.4GHz) Conducted Output Powers

#### Required Test channels

Mode	Band	Frequency (GHz)	Channel	"Default Test Channels"	
				802.11b	802.11g
802.11b	2.4 GHz	2.412	1 <sup>#</sup>	√	▽
		2.437	6	√	▽
		2.462	11 <sup>#</sup>	√	▽

Notes:

√ = "default test channels"

▽ = possible 802.11g channels with maximum average output 1/4 dB higher than the "default test channels"

<sup>#</sup> = when output power is reduced for channel 1 and/or 11 to meet restricted band requirements the highest output channels closest to each of these channels should be tested.

#### Conducted Output Powers

WLAN mode	Worst Power Data Rate [Mbps]	Conducted Powers (dBm)		
		2412MHz	2437MHz	2462MHz
802.11b	1	13.93	<b>14.12</b>	14.03
	2	14.01	13.95	13.93
	5.5	13.90	13.82	14.08
	11	13.95	13.96	14.08
802.11g	6	14.08	14.08	14.09
	9	13.94	14.20	13.95
	12	13.96	14.71	14.16
	18	14.12	<b>14.97</b>	14.25
	24	13.95	13.99	14.32
	36	14.08	14.28	14.06
	48	13.88	13.87	13.87
	54	13.51	13.80	13.71
802.11n	MCS0	13.61	13.82	13.80
	MCS1	13.96	13.98	13.98
	MCS2	13.85	13.97	13.85
	MCS3	13.61	14.25	13.90
	MCS4	13.94	13.87	13.99
	MCS5	13.47	13.33	13.54
	MCS6	13.53	13.35	13.36
	MCS7	12.50	12.75	12.62

Note: Per KDB 248227 D01, SAR is not required for 802.11n mode when the maximum average output power is less than 1/4 dB higher than that measured on the corresponding 802.11b mode.

### 11.5. Bluetooth Conducted Output Powers

Modulation	Max Allowed Output Power (mW)
Bluetooth (GFSK, 8-DPSK)	2.52 (4dBm)

Per FCC KDB 447498 D01v05, the SAR exclusion threshold for distance <50mm is defined by the following equation:

$$\frac{\text{Max Power of Channel (mW)}}{\text{Test Separation Dist (mm)}} * \sqrt{\text{Frequency(GHz)}} \leq 3.0$$

Based on the maximum conducted power of Bluetooth (rounded to the nearest mW) and the antenna to user separation distance, **Bluetooth body-worn accessory SAR was not required.**  $[(2.52/15)*\sqrt{2.441}] = 0.26 < 3.0$

## 12. SAR TEST CONDITIONS & ANTENNA INFORMATION

### 12.1. Standalone SAR Measurements

Test Modes	Head SAR	Body SAR	Note
WWAN	Yes	Yes	
2.4 GHz WLAN	Yes	Yes	
Bluetooth	No	No	SAR is not required according to the KDB 447498 D01 - 1g SAR test Exclusion thresholds conditions.

### 12.2. Simultaneous SAR Measurements

RF Exposure Condition	Capable Transmit Configurations
Head	WWAN+BT only
Body	WWAN+BT only
Hotspot & WiFi Direct	Not supported

### 12.3. Antenna Information

### 13.4. SAR Test Notes

#### General Notes:

1. The test data reported are the worst-case SAR values according to test procedures specified in IEEE 1528-2003, FCC KDB Procedure.
2. Batteries are fully charged at the beginning of the SAR measurements.
3. 1D scanner(N4313) base model was fully tested. And 1D scanners (uE966) base model was tested at the worst configurations.
4. Liquid tissue depth was at least 15.0 cm for all frequencies.
5. The manufacturer has confirmed that the device(s) tested have the same physical, mechanical and thermal characteristics and are within operational tolerances expected for production units.
6. SAR results were scaled to the maximum allowed power to demonstrate compliance per FCC KDB 447498 D01v05.
7. Per FCC KDB 648474 D04v01, SAR was evaluated without a headset connected to the device. Since the standalone reported SAR was less than 1.2 W/kg, no additional SAR evaluation using a headset cable were required.
8. Per FCC KDB 865664 D01v01, variability SAR tests were not performed since the measured SAR results for all frequency bands were less than 0.8 W/kg. Please see Section 13 for variability analysis information.

#### CDMA Test Notes:

1. SAR for head exposure configurations is measured in RC3 with the DUT configured to transmit at full rate using Loopback Service Option SO55.
2. SAR for body exposure configurations is measured in RC3 with the DUT configured to transmit at full rate on FCH with all other code channels disabled using TDSO / SO32.
3. Per FCC KDB 447498 D01v05, if the reported (scaled) SAR measured at the middle channel or highest output power channel for each test configuration is  $\leq 0.8$  W/kg then testing at the other channels is not required for such test configuration(s). Since the maximum output power variation across the required test channels is  $\leq 1/2$  dB, middle channel was the default channel used.

#### WLAN Test Notes:

1. Justification for reduced test configurations for WIFI channels per KDB 248227 D01v01r02 and Oct. 2012 FCC/TCB Meeting Notes for 2.4 GHz WIFI: Highest average RF output power channel for the worst data rate was selected for SAR evaluation in 802.11b/g. 802.11n mode was not investigated since the average output powers over all channels and data rates were not more than 0.25 dB higher than the tested channel in the lowest data rate of IEEE 802.11b mode.
2. Since the maximum extrapolated peak SAR of the zoom scan for the maximum output channel was  $\leq 1.6$  W/kg and the reported 1g averaged SAR was  $\leq 0.8$  W/kg, SAR testing on other default channels was not required.

## 14. MULTI-TX CONSIDERATION

### 14.1. Introduction

The following procedures adopted from FCC KDB Publication 447498 D01v05 are applicable to handsets with built-in unlicensed transmitters such as 802.11a/b/g/n/ac and Bluetooth devices which may simultaneously transmit with the licensed transmitter.

### 14.2. Simultaneous Transmission Procedures

This device contains transmitter that may operate simultaneously. Therefore simultaneous transmission analysis is required. Per FCC KDB 447498 D01v05 IV.C.1.iii, simultaneous transmission SAR test exclusion may be applied when the sum of the 1-g SAR for all the simultaneous transmitting antennas in a specific physical test configuration is  $\leq 1.6$  W/kg. When standalone SAR is not required to be measured, per FCC KDB 447498 D01v05 4.3.2 2), the following equation must be used to estimate the standalone 1g SAR for simultaneous transmission assessment involving that transmitter.

$$\text{Estimated SAR} = \frac{\sqrt{f(\text{GHz})}}{7.5} * \frac{(\text{Max Power of channel, mW})}{\text{Min. Separation Distance, mm}}$$

Mode	Frequency	Maximum Allowed Power		Separation Distance (body)	Estimated SAR(body)
	[MHz]	[dBm]	[mW]	[mm]	[W/kg]
Bluetooth	2441	3.73	2.36	15	0.035

Note: Per KDB Publication 447498 D01v05r01, the maximum power of the channel was rounded to the nearest mW before calculation.

### 14.3. Body SAR Simultaneous Transmission Analysis

Worst Configuration	Mode	SAR (W/kg)	Bluetooth SAR (W/kg)	$\Sigma$ SAR (W/kg)
Right Touch	CDMA850	0.594	0.035	0.629
Left Touch	CDMA1900	0.167	0.035	0.202
Rear Side	CDMA850	0.422	0.035	0.457
Rear Side	CDMA1900	0.331	0.035	0.366

Note: Bluetooth SAR was not required to be measured per FCC KDB 447498. Estimated SAR results were used in the above table to determine simultaneous transmission SAR test exclusion.

---

## 15. SAR MEASUREMENT VARIABILITY

### 15.1. Measurement Variability

Per FCC KDB Publication 865864 D01v01, SAR measurement variability was assessed when measured 1g SAR is > 0.80 W/kg or when measured 10g SAR is >2.00 W/kg. Since all measured 1g SAR values were <0.8 W/kg SAR measurement variability was not assessed.

### 15.2. Measurement Uncertainty

The measured SAR was <1.5 W/kg for all frequency bands. Therefore, per KDB Publication 865664 D01v01, the extended measurement uncertainty analysis per IEEE 1528-2003 was not required.

---

## 16. CONCLUSION

The SAR evaluation indicates that NAUTIZ X4 complies with the RF radiation exposure limits of the FCC. These measurements were taken to simulate the RF effects of RF exposure under worst-case conditions. Precise laboratory measures were taken to assure repeatability of the tests. The results and statements relate only to the item(s) tested.

## APPENDIX A. SAR PLOTS

- Test Laboratory: KTL
- Model: NAUTIZ X4
- Position: CDMA850 RIGHT CHEEK TOUCH\_CH384
- Test Date: 02/21/2014
- Measured Liquid Temperature: 22.5 °C, Ambient Temperature: 22.1 °C

Communication System: CDMA 835; Frequency: 836.52 MHz; Duty Cycle: 1:1  
Medium: HSL835 Medium parameters used:  $f = 836.52$  MHz;  $\sigma = 0.91$  mho/m;  $\epsilon_r = 42.1$ ;  $\rho = 1000$  kg/m<sup>3</sup>

Phantom section: Right Section

Measurement Standard: DASY4 (High Precision Assessment)

DASY4 Configuration:

- Probe: EX3DV4 - SN3972; ConvF(9.75, 9.75, 9.75); Calibrated: 2014-01-28
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn1422; Calibrated: 2014-01-13
- Phantom: SAM Twin Phantom\_835MHz; Type: SAM; Serial: TP-1276
- Measurement SW: DASY4, V4.7 Build 71; Postprocessing SW: SEMCAD, V1.8 Build 184

**Area Scan (61x111x1):** Measurement grid: dx=15mm, dy=15mm

Maximum value of SAR (interpolated) = 0.553 mW/g

**Zoom Scan (5x5x7)/Cube 0:** Measurement grid: dx=8mm, dy=8mm, dz=5mm

Reference Value = 7.94 V/m; Power Drift = -0.108 dB

Peak SAR (extrapolated) = 0.647 W/kg

**SAR(1 g) = 0.523 mW/g; SAR(10 g) = 0.406 mW/g**

Maximum value of SAR (measured) = 0.549 mW/g

0 dB = 0.549mW/g

- Test Laboratory: KTL
- Model: NAUTIZ X4
- Position: CDMA850 BODY REAR 1.5cm\_1013CH
- Test Date: 05/12/2014
- Measured Liquid Temperature: 22.7 °C, Ambient Temperature: 22.1 °C

Communication System: CDMA 835; Frequency: 848.31 MHz; Duty Cycle: 1:1  
Medium: MSL835 Medium parameters used:  $f = 848.8$  MHz;  $\sigma = 0.93$  mho/m;  $\epsilon_r = 53.8$ ;  $\rho = 1000$  kg/m<sup>3</sup>

Peak SAR (extrapolated) = 19.5 W/kg

**SAR(1 g) = 10.7 mW/g; SAR(10 g) = 5.65 mW/g**

Maximum value of SAR (measured) = 12.0 mW/g

**1900 MHz Body- Verification DATA (D1900V2 – 5d038)**

**- Test Date: 2/25/2014**

**- Measured Liquid Temperature: 22.2 °C, Ambient Temperature: 22.0 °C**

Communication System: CW; Frequency: 1900 MHz; Duty Cycle: 1:1

Medium: MSL1900 Medium parameters used:  $f = 1900 \text{ MHz}$ ;  $\sigma = 1.53 \text{ mho/m}$ ;  $\epsilon_r = 53$ ;  $\rho = 1000 \text{ kg/m}^3$

Phantom section: Flat Section

Measurement Standard: DASY4 (High Precision Assessment)

DASY4 Configuration:

- Probe: EX3DV4 - SN3972; ConvF(7.58, 7.58, 7.58); Calibrated: 2014-01-28
- Sensor-Surface: 4mm (Mechanical Surface Detection) Sensor-Surface: 0mm (Fix Surface)
- Electronics: DAE4 Sn1422; Calibrated: 2014-01-13
- Phantom: SAM Twin Phantom\_1800MHz; Type: SAM; Serial: TP-1433
- Measurement SW: DASY4, V4.7 Build 71; Postprocessing SW: SEMCAD, V1.8 Build 184

**1900 Validation /Area Scan (61x71x1):** Measurement grid:  $dx=15\text{mm}$ ,  $dy=15\text{mm}$

Maximum value of SAR (interpolated) = 13.3 mW/g

**1900 Validation /Z Scan (1x1x16):** Measurement grid:  $dx=20\text{mm}$ ,  $dy=20\text{mm}$ ,  $dz=20\text{mm}$

Maximum value of SAR (interpolated) = 3.89 mW/g

**1900 Validation /Zoom Scan (7x7x7)/Cube 0:** Measurement grid:  $dx=5\text{mm}$ ,  $dy=5\text{mm}$ ,  $dz=5\text{mm}$

Reference Value = 90.6 V/m; Power Drift = 0.005 dB

Peak SAR (extrapolated) = 20.4 W/kg

**SAR(1 g) = 11 mW/g; SAR(10 g) = 5.67 mW/g**

Maximum value of SAR (measured) = 12.4 mW/g

**1900 MHz Body- Verification DATA (D1900V2 – 5d038)**

**- Test Date: 05/13/2014**

**- Measured Liquid Temperature: 22.2 °C, Ambient Temperature: 22.0 °C**

Communication System: CW; Frequency: 1900 MHz; Duty Cycle: 1:1

Medium: MSL1900 Medium parameters used:  $f = 1900 \text{ MHz}$ ;  $\sigma = 1.53 \text{ mho/m}$ ;  $\epsilon_r = 52.9$ ;  $\rho = 1000 \text{ kg/m}^3$
