

Bluetooth is a worldwide standard for the wireless exchange of data between two compatible devices. It utilizes short-distance radio link technology and replaces the traditional cable connections to enable wireless connections between desktop and laptop computers, cellular phones, scanners, digital cameras, printers, and other devices. You can now transfer files between two computers, dial up to the Internet using the host computer's modem or a cell phone, or even share a network connection without literally attaching your cables to a device. To put it simply, Bluetooth unplugs all your cables and lets you forget about cable clutter for a change.
